## Integrated Dual-port Multi-speed Ethernet Transceiver with Electronic Dispersion Compensation Technology

### Datasheet – Public

## PRODUCT OVERVIEW

---

The Marvell® 88X2222 transceiver is a fully integrated single chip solution providing end-to-end data transmission over fiber-optic networks as well as Twinax® copper links. It is a 2-port device that performs all physical layer functions associated with 10GBASE-R, and 1000BASE-X.

The Electronic Dispersion Compensation (EDC) engine delivers high-speed bi-directional point-to-point full duplex data transmission at 10.3 Gbps per port over a variety of media. The performance of the engine can be reduced to save power in fiber-optic applications that does not require EDC.

The line-side interface supports 2 ports of 10GBASE-R and 1000BASE-X. The line side also supports Clause 73 AP Auto-Negotiation.

The host-side interface supports 4 ports of 10GBASE-R, RXAUI, 1000BASE-X, and 2 ports of XAUI. Any port from the host side can be attached to any port on the line side as long as the speeds match.

Internal registers can be accessed via an MDIO/MDC serial management interface which is compliant with the IEEE 802.3 specification (Clause 45). The MDC frequency supported is up to 25 MHz.

The 88X2222 is manufactured in a 19 mm × 19 mm 324-pin FCBGA package.

## Features

- 10GBASE-R, 1000BASE-X support on the line interface
- EDC meets SFF-8431 requirements (SFP+MSA)
- MMF compensation exceeding 220m of OM1, OM2, and OM3 fibers
- SFF-8431 requirements are supported
- SMF CD/PMD compensation exceeding 80 km
- 10GBASE-R, RXAUI, XAUI, and 1000BASE-X support on the host interface
- Transmitter adjustable signal level and pre-emphasis
- IEEE 802.3 local/remote fault monitoring at SFP/SFP+ interface
- Built-in generators and checkers
- Programmable inversion on all differential signals
- Power saving modes
- Global multi-status interrupt pin
- Per-port TWSI for SFP IDPROM access (Note: SSCL clock stretching is not supported.)
- Near and far-end loopbacks
- Supports IEEE-1149.1 and 1149.6 JTAG

## Applications

- High-density line card SFP+ interfacing
- SFP+ modules, 10GSFP+Cu direct-attach cables
- 1G SFP modules
- Switch to switch bridging

Figure 1: 88X2222 Application Diagram

**MAC Interface**

- 4 Port – 1000BASE-X
- 4 Port – 10GBASE-R
- 4 Port – RXAUI
- 2 Port – XAUI

**Media Interface**

- 2 Port – 1000BASE-X
- 2 Port – 10GBASE-R

# 1

## General Device Description

The line side and host side support various modes of operation for end-to-end data transmission over multi-mode fiber, single mode fiber, and Twinax copper cables. The DSP engine overcomes the impairments of the fiber cable, optical front end, and electrical interconnect.

Registers can be accessed by the host through standard clause 45 MDC/MDIO.

The device operates from a 1.0V digital core voltage and a 1.5V analog voltage. The digital I/O signals can operate at 1.5V, 1.8V, 2.5V, and 3.3V.

Figure 1 shows a block diagram of the 88X2222 device.

Figure 1: 88X2222 Device Functional Block Diagram

## Signal Description

This section includes information on the following topics:

- [Section 2.1, 88X2222 BGA Package](#)
- [Section 2.2, Pin Description](#)
- [Section 2.3, 88X2222 Pin Assignments](#)
- [Section 2.4, 88X2222 Device Pin Assignment List](#)

### 2.1 88X2222 BGA Package

---

**Note**

Due to the large number of pins, the FCBGA package is depicted graphically over 2 facing pages. For pin 1 location, see [Figure 51 on page 254](#).

---

U17 U15 U13 U11 U8 U6 U4 U2	MOP[7] MOP[6] MOP[5] MOP[4] MOP[3] MOP[2] MOP[1] MOP[0]	Analog Output	XFI Output Positive
V17 V15 V13 V11 V8 V6 V4 V2	MON[7] MON[6] MON[5] MON[4] MON[3] MON[2] MON[1] MON[0]	Analog Output	XFI Output Negative

**Table 4: Clocking and Reference**

Package Pin #	Pin Name	Pin Type	Description
M1	CLKP	Analog Input	Reference Clock Positive and Negative. REF_CLK is 156.25 MHz. See <a href="#">Section 7.8, Reference Clock</a> , on page 248 for details.
N1	CLKN	Analog Input	
A4	WAN_CLKP	Analog Input	Reserved. For test purposes only Terminate both pins using 50 $\Omega$ to ground.
A5	WAN_CLKN	Analog Input	
F7	NIVREF	Analog Output	Resistor Reference. External 3.65 k $\Omega$ $\pm$ 1% resistor connection to VSS is required for this pin.
K1	RCLK0	Digital Output	Reserved. For test purposes only. Leave floating.
K2	RCLK1	Digital Output	Reserved. For test purposes only. Leave floating.

**Table 5: Configuration and Reset**

Package Pin #	Pin Name	Pin Type	Description
D4	VSEL_L	Analog Input	VDDOL Voltage Select 0 - VDDOL = 2.5V/3.3V 1 - VDDOL = 1.2V/1.8V
L17	VSEL_M	Analog Input	VDDOM Voltage Select 0 - VDDOM = 2.5V/3.3V 1 - VDDOM = 1.2V/1.8V
E16	VSEL_S	Analog Input	VDDOS Voltage Select 0 - VDDOS = 2.5V/3.3V 1 - VDDOS = 1.2V/1.8V

**Table 5: Configuration and Reset (Continued)**

Package Pin #	Pin Name	Pin Type	Description
K4	VSEL_T	Analog Input	VDDOT Voltage Select 0 - VDDOT = 2.5V/3.3V 1 - VDDOT = 1.2V/1.8V
B2 C2 E2 F2	CONFIG[3] CONFIG[2] CONFIG[1] CONFIG[0]	Digital Input	Hardware Configuration
L4 L3	FREQ_SEL[1] FREQ_SEL[0]	Digital Input	CLKP/N Frequency 00 = 156.25 MHz 01 = Reserved 10 = Reserved 11 = Reserved
L2	RESETn	Digital Input	Hardware Reset, 0 = Reset

**Table 6: Management Interface**

Package Pin #	Pin Name	Pin Type	Description
K18	MDC	Digital Input	Management Interface Clock
L18	MDIO	Digital Input/Output	Management Interface Data Bi-directional management interface data transferred synchronously to the MDC. This pin requires a pull-up resistor in a range from 1.5k to 10 kΩ.
K17	INTn	Digital Output	Interrupt

**Table 7: SFP+, GPIO, LED**

## Chip-level Functional Description

This section includes information on the following topics:

- [Section 3.1, Data Path](#)
- [Section 3.2, Frequency Compensation FIFOs](#)
- [Section 3.3, Resets](#)
- [Section 3.4, Hardware Configuration](#)
- [Section 3.5, MDC/MDIO Register Access](#)
- [Section 3.6, GPIO and SFP+](#)
- [Section 3.7, LED](#)
- [Section 3.8, EEPROM Bridging and Polling](#)
- [Section 3.9, Interrupt](#)
- [Section 3.10, Power Management](#)
- [Section 3.11, IEEE1149.1 and 1149.6 Controller](#)
- [Section 3.12, Reference Clock](#)
- [Section 3.13, Synchronous Ethernet Recovered Clocks](#)
- [Section 3.14, Power Supplies](#)

This section describes the chip-level functionality. [Section 4, Line-side Description, on page 84](#) and [Section 5, Host-side Description, on page 93](#) describe the individual units in detail.

### 3.1 Data Path

[Figure 4](#) illustrates the data path of both devices. This section examines the multiplexing in more detail.

#### 3.1.1 Cross Port Multiplexing

Although the device supports multiple different PCS with the various PCS attached to 1 or more physical lanes, the device can be fundamentally viewed as 2 ports on the line side and 4 ports on the host side. Any of the 2 ports on the line side can be attached to any of the 4 ports on the host side by programming the cross port multiplexer. The association between the line and host side can be independently programmed for ingress and egress paths and need not be the same for both directions. It is also possible for data received on one port of the line (host) side to be transmitted out on more than 1 port of the host (line) side.

**Figure 4: Cross Port Multiplexing**

The attached ports must run at the same speed (though the PCS types can be different). All speeds are not supported on all ports. It is the user's responsibility to ensure that the cross port multiplexing is set correctly.

Registers 31.F400 bits 3:0 and 11:8 control which port on the host side attaches to ports 0 and 2 of the line-side port transmitter respectively.

0000 = Power down the line-side port transmitter

0001 = Output idles on the line-side port transmitter

1000 = Attach to host-side port 0

1001 = Attach to host-side port 1

1010 = Attach to host-side port 2

1011 = Attach to host-side port 3

Registers 31.F401 bits 3:0, 7:4, 11:8, and 15:12 controls which port on the line side attaches to ports 0, 1, 2, and 3 of the host-side port transmitter respectively.

0000 = Power down the host-side port transmitter

0001 = Output idles on the host-side port transmitter

1000 = Attach to line-side port 0

1010 = Attach to line-side port 2

Registers 31.F400 and 31.F401 are global registers and can be accessed from port 0 PHYAD.

### 3.1.2 PCS Operational Mode and Lane Attachment

Each port supports multiple PCS. Not all PCS are supported by all ports. Only 1 PCS can be enabled at a time for a given port, but different PCS can be selected among the different ports.

Since some PCS requires more lanes to operate than others, it is possible that conflicts can exist (for example, Port 0 in XAUI mode conflicting with the other 3 ports). In case of conflict, the lower numbered port will have the higher priority over the higher numbered port. The PCS on the port with the lower priority that has conflict will be automatically powered down.

Register 31.F002.14:8 and 31.F002.6:0 selects the PCS type for the line and host side, respectively. Not all PCS type are available for each port. [Table 13](#) lists out which PCS is available for each port. [Table 14](#) and [Table 15](#) list the pin mappings for PCS modes for the line and host interfaces. [Table 16](#) and [Table 17](#) list the valid 7 bit setting for registers 31.F002.14:8 and 31.F002.6:0.

**Table 13: PCS Availability by Port**

PCS Type	Line-side Port N		Host-side Port M			
	N0	N2	M0	M1	M2	M3

	XAUI Port 2							

**Table 16: Valid Settings — Line Side**

31.F002.14:8	PCS	Auto-Negotiation
1110001	10GBASE-R	N/A
1111010	1000BASE-X	Off
1111011		On
1111100	SGMII (System)	Off
1111101		On
1111110	SGMII (Network)	Off
1111111		On

**Table 17: Valid Settings — Host Side**

31.F002.6:0	PCS	Auto-Negotiation
1110001	10GBASE-R	N/A
1110010	RXAUI	N/A
1110011	XAUI	N/A
1111010	1000BASE-X	Off
1111011		On
1111100	SGMII (System)	Off
1111101		On
1111110	SGMII (Network)	Off
1111111		On

Although the various lanes can support multiple speeds, there are limitations on which speed combinations can be supported across the various lanes simultaneously.

### 3.1.3 Loopback and Bypass

Figure 5 illustrates the possible loopback and bypass paths: note that the cross port multiplexing is not shown in the figure.

For information, see the following sections:

- Line side loopbacks—Section 4.3, Loopback
- Host side loopbacks—Section 5.3, Loopback

Figure 5: 88X2222 Device Data Path

## 3.2 Frequency Compensation FIFOs

There are FIFOs in the PCS blocks to compensate the frequency offset between the host and line. The FIFO positions are illustrated in Figure 5. The FIFO depth can be set via register 3.F00C.15:14 for the line side and register 4.F00C.15:14 for the host side.

### 3.2.1 Host-side Lane Attachment

Table 18 shows which PCS are available and which lane attachments are possible.

The 1000BASE-X and 10GBASE-R may be attached to different logical lanes to facilitate connection to various different legacy switches. Register 31.F402.12:8 controls which lanes attach to which PCS.

Table 18: Host-side Line Muxing

Register	Function	Setting
31.F402.11	RXAUI Attachment	0 = Ports 0, 2 attached to logical lanes 0/1, 4/5 1 = Ports 0, 2 attached to logical lanes 0/1, 2/3
31.F402.9	10BASE-R Attachment	0 = Ports 0, 1, 2, 3 attached to logical lanes 0, 2, 4, 6 1 = Ports 0, 1, 2, 3 attached to logical lanes 0, 1, 2, 3
31.F402.8	1000BASE-X Attachment	0 = Ports 0, 1, 2, 3 attached to logical lanes 0, 2, 4, 6 1 = Ports 0, 1, 2, 3 attached to logical lanes 0, 1, 2, 3

Table 19: Physical Lane to PCS Mapping

			1000BASE-X (1)		1000BASE-X (0)				31.F402.8 0 = Lane 4 1 = Lane 2
Port 3							RXAUI		
				10GBASE-R (1)			10GBASE-R (0)		31.F402.9 0 = Lane 6 1 = Lane 3
				1000BASE-X (1)			1000BASE-X (0)		31.F402.8 0 = Lane 6 1 = Lane 3

### 3.2.2 Polarity Inversion

The polarity of each lane can be independently inverted.

Registers 31.F406 bit 0 to 7 controls the polarity of MOP/N[0] to MOP/N[7] respectively.

Registers 31.F406 bit 8 to 15 controls the polarity of MIP/N[0] to MIP/N[7] respectively.

Registers 31.F407 bit 0 and 2 controls the polarity of NOP/N[0] and NOP/N[2] respectively.

Registers 31.F407 bit 8 and 10 controls the polarity of NIP/N[0] and NIP/N[3] respectively.

0 = Normal polarity

1 = Reverse polarity

### 3.3 Resets

A hardware reset (RESETn) resets the entire chip and initializes all the registers to their hardware reset default.

A software reset has a similar effect on the affected units as a hardware reset except all Retain type of registers hold their value, and any previously written values in the 'Update' registers take effect.

To assert a host-/line-side port reset, set:

- 31.F003.15 to 1 for line side of the port
- 31.F003.7 to 1 for host side of the port

Refer to [Section 4.5, Power Management, on page 88](#) for the line-side PCS and PMA resets, and [Section 5.5, Power Management, on page 96](#) for the host-side PCS and PMA resets.

To assert a global chip-level soft reset, set:

- 31.0xF404.15
- 31.0xF404.14

## 3.4 Hardware Configuration

After de-assertion of RESETn, the 88X2222 device will be hardware configured.

The 88X2222 device is configured through the CONFIG[3:0] pins.

Each CONFIG[3:0] pin is used to configure 2 bits. The 2-bit value is set depending on what is connected to the CONFIG pins soon after de-assertion of hardware reset. The 2-bit mapping is shown in [Table 20](#).

**Table 20: Two Bit Mapping**

Pin	Bit 1,0
VSS	00
LED0[0]	01
LED1[0]	10
VDDO	11

The 2 bits for the CONFIG pin is mapped as shown in [Table 21](#).

**Table 21: Configuration Mapping**

Pin	CONFIG Bit1	CONFIG Bit 0
CONFIG[0]	Must be 0	Must be 0
CONFIG[1]	PHYAD[3]	PHYAD[2]
CONFIG[2]	PDSTATE	PHYAD[4]
CONFIG[3]	Reserved Tie to 0	Reserved Tie to 0

Each bit in the configuration is defined as shown in [Table 22](#).

**Table 22: Configuration Definition**

Bits	Definition	Register Affected
PHYAD[4:0]	PHY Address for port 0. Port n address is (PHYAD[4:2], 0,0) + n	None
PDSTATE	0 = Start In Power Up State 1 = Start In Power Down State	31.F400.15:0 31.F401.15:0 31.F403.7:0

The `FREQ_SEL[1:0]` must be set to 00. All other settings are reserved.

## 3.5 MDC/MDIO Register Access

The management interface provides access to the internal registers via the MDC and MDIO pins and is compliant with IEEE 802.3 clause 45. MDC is the management data clock input and, it can run from DC to a maximum rate of 25 MHz. At high, MDIO fanouts the maximum rate may be decreased depending on the output loading. MDIO is the management data input/output and is a bi-directional signal that runs synchronously to MDC.

The MDIO does not require a pull-up resistor. If another open-drain device driving MDIO requires a pull-up resistor, it should drive or be pulled up to the same voltage value as the DVDDIO rail.

PHY address is configured during the hardware reset sequence. For more information on how to configure PHY addresses, see [Section 3.4, Hardware Configuration, on page 46](#).

Typical read and write operations on the management interface are shown in [Figure 6](#) and [Figure 7](#). All the required serial management registers are implemented as well as several optional registers. A description of the registers can be found in [Section 6, Register Description, on page 100](#).

**Figure 6: Typical MDC/MDIO Read Operation**

**Figure 7: Typical MDC/MDIO Write Operation**

### 3.5.1 Clause 45 MDIO Framing

The MDIO interface frame structure is compatible with Clause 22 such that the 2 management interfaces can co-exist on the same MDIO bus.

The extensions for Clause 45 MDIO indirect register accesses are specified in [Table 23](#).

**Table 23: Extensions for Management Frame Format for Indirect Access**

Frame	PRE	ST	OP	PHYAD	DEVADR	TA	ADDRESS/DATA	Idle
Address	1...1	00	00	PPPPP	DDDDD	10	AAAAAAAAAAAAAAAA	Z
Write	1...1	00	01	PPPPP	DDDDD	10	DDDDDDDDDDDDDDDD	Z
Read	1...1	00	11	PPPPP	DDDDD	Z0	DDDDDDDDDDDDDDDD	Z
Read Increment	1...1	00	10	PPPPP	DDDDD	Z0	DDDDDDDDDDDDDDDD	Z

The MDIO implements a 16-bit address register that stores the address of the register to be accessed. For an address cycle, it contains the address of the register to be accessed on the next cycle. For read, write, post-read-increment-address cycles, the field contains the data for the register. At power up and reset, the contents of the register are undefined.

Write, read, and post-read-increment-address frames access the address register, though write and read frames do not modify the contents of the address register.

### 3.5.2 High-Speed MDC/MDIO Management Interface Protocol

In addition to supporting the typical MDC/MDIO protocol, the device has the capability to run MDC as fast as 40 MHz. Write operation can operate normally at this speed; however, for read operation, the MDC clock cycle must be slowed down for the TA period as shown in the [Figure 8](#).

During read operations, the MDC clock must slow down so that the PHY has enough time to fetch the data. There are 2 scenarios. In 1 scenario, the MDIO has exclusive access to the internal register bus.

For timing details, see [Table 345 on page 233](#).

**Figure 8: 40 MHz MDC/MDIO Read Operation**

## 3.6 GPIO and SFP+

The GPIO, LED, and TWSI functions share the same set of signal pins. Each pin can be individually programmed to operate in 1 of the 3 functions. The GPIO and TWSI functions can be combined to form the SFP+ digital interface. The pin mapping is summarized in [Table 24](#).

**Table 24: GPIO, LED, and TWSI Signal Mapping**

Signal	GPIO	LED	TWSI	SFP+	Default Mode
MOD_ABS	MOD_ABS			Module Attached	GPIO Input
TX_FAULT	TX_FAULT			Transmit Fault	GPIO Input
RX_LOS	RX_LOS			Receive Loss of Signal	GPIO Input
GPIO	GPIO				GPIO Input
LED0	GPIO[4]	LED0			LED Function
LED1	GPIO[5]	LED1			LED Function
MPC	GPIO[6]	MPC		Module Power	GPIO Output Low
TOD	GPIO[7]	TOD			DSP Locked
TX_DISABLE	GPIO[8]	TX_DISABLED		Transmit Disable	GPIO Output High
SDA	GPIO[10]		TWSI Serial Data	TWSI Serial Data	TWSI
SCL	GPIO[11]		TWSI Clock	TWSI Clock	TWSI
	Bit 9 not used				

The GPIO function enables the pins listed in [Table 24](#) to function as GPIO ports. Each pin can operate bi-directionally and can be individually configured. When operating as an output, these pins operate as open drain.

### 3.6.1 Enabling GPIO Functionality

The TX\_DISABLED, TOD, MPC, LED1, and LED0 pins operates in the LED mode unless register 31.F016.4:3 is set to 01, and 31.F014.11, 31.F014.7, 31.F015.15, 31.F015.11, 31.F015.7, 31.F015.3 respectively are set to 1. Once set to 1, the LED pins can be controlled via the GPIO registers.

The SCL and SDA pins operate in the TWSI mode unless register 31.F016.15 and 31.F016.11 respectively are set to 1. Once set to 1, the SCL and SDA pins can be controlled via the GPIO registers.

The GPIO, RX\_LOS, TX\_FAULT, and MOD\_ABS pins can always be controlled via the GPIO registers.

### 3.6.2 Controlling and Sensing

Register 31.F013 controls whether the GPIO pins are inputs or outputs. Each pin can be individually controlled.

Register 31.F012 allows the pins to be controlled and sensed.

When configured as input, a read to register 31.F012 will return the real-time sampled state of the pin at the time of the read. A write will write the output register but has no immediate effect on the pin since the pin is configured to be an input. The input is sampled once every 38.4 ns.

When configured as output, a read to register 31.F012 returns the value in the output register. A write writes the output register which in turn drives the state of the pin.

Table 25: GPIO Data

Register	Function	Setting	Mode
31.F012.11	SCL Data	This bit has no effect unless register 31.F016.15 = 1. When 31.F013.11 = 0, a read to this register will reflect the state of the SCL pin, and a write will write the output register but will have no effect on the SCL pin. When 31.F013.11 = 1 a read to this register will reflect the state of the output register, and a write will write the output register and will drive the state of the SCL pin.	R/W
31.F012.10	SDA Data	This bit has no effect unless register 31.F016.11 = 1. When 31.F013.10 = 0, a read to this register will reflect the state of the SDA pin, and a write will write the output register but will have no effect on the SDA pin. When 31.F013.10 = 1 a read to this register will reflect the state of the output register, and a write will write the output register and will drive the state of the SDA pin.	R/W
31.F012.8	TX_DISABLED Data	This bit has no effect unless register 31.F016.3 = 1. When 31.F013.8 = 0, a read to this register will reflect the state of the TX_DISABLED pin, and a write will write the output register but will have no effect on the TX_DISABLED pin. When 31.F013.8 = 1 a read to this register will reflect the state of the output register, and a write will write the output register and will drive the state of the TX_DISABLED pin.	R/W
31.F012.7	TOD Data	This bit has no effect unless register 31.F015.15 = 1. When 31.F013.7 = 0, a read to this register will reflect the state of the TOD pin, and a write will write the output register but will have no effect on the TOD pin. When 31.F013.7 = 1 a read to this register will reflect the state of the output register, and a write will write the output register and will drive the state of the TOD pin.	R/W

Table 25: GPIO Data (Continued)

Register	Function	Setting	Mode
31.F012.6	MPC Data	This bit has no effect unless register 31.F015.11 = 1. When 31.F013.6 = 0, a read to this register will reflect the state of the MPC pin, and a write will write the output register but will have no effect on the MPC pin. When 31.F013.6 = 1 a read to this register will reflect the state of the output register, and a write will write the output register and will drive the state of the MPC pin.	R/W
31.F012.5	LED1 Data	This bit has no effect unless register 31.F015.7 = 1. When 31.F013.5 = 0, a read to this register will reflect the state of the LED1 pin, and a write will write the output register but will have no effect on the LED1 pin. When 31.F013.5 = 1 a read to this register will reflect the state of the output register, and a write will write the output register and will drive the state of the LED1 pin.	R/W
31.F012.4	LED0 Data	This bit has no effect unless register 31.F015.3 = 1. When 31.F013.4 = 0, a read to this register will reflect the state of the LED0 pin, and a write will write the output register but will have no effect on the LED0 pin. When 31.F013.4 = 1 a read to this register will reflect the state of the output register, and a write will write the output register and will drive the state of the LED0 pin.	R/W
31.F012.3	GPIO Data	When 31.F013.9 = 0, a read to this register will reflect the state of the GPIO pin, and a write will write the output register but will have no effect on the GPIO pin. When 31.F013.9 = 1 a read to this register will reflect the state of the output register, and a write will write the output register and will drive the state of the GPIO pin.	R/W
31.F012.2	RX_LOS Data	When 31.F013.2 = 0, a read to this register will reflect the state of the RX_LOS pin, and a write will write the output register but will have no effect on the RX_LOS pin. When 31.F013.2 = 1 a read to this register will reflect the state of the output register, and a write will write the output register and will drive the state of the RX_LOS pin.	R/W
31.F012.1	TX_FAULT Data	When 31.F013.1 = 0, a read to this register will reflect the state of the TX_FAULT pin, and a write will write the output register but will have no effect on the TX_FAULT pin. When 31.F013.1 = 1 a read to this register will reflect the state of the output register, and a write will write the output register and will drive the state of the TX_FAULT pin.	R/W
31.F012.0	MOD_ABS Data	When 31.F013.0 = 0, a read to this register will reflect the state of the MOD_ABS pin, and a write will write the output register but will have no effect on the MOD_ABS pin. When 31.F013.0 = 1 a read to this register will reflect the state of the output register, and a write will write the output register and will drive the state of the MOD_ABS pin.	R/W

**Table 26: GPIO Tristate Control**

Register	Function	Setting	Mode
31.F013.11	SCL Output Enable	This bit has no effect unless register 31.F016.15 = 1. 0 = Input, 1 = Output	R/W
31.F013.10	SDA Output Enable	This bit has no effect unless register 31.F016.11 = 1. 0 = Input, 1 = Output	R/W
31.F013.8	TX_DISABLED Output Enable	This bit has no effect unless register 31.F016.3 = 1. 0 = Input, 1 = Output	R/W
31.F013.7	TOD Output Enable	This bit has no effect unless register 31.F015.15 = 1. 0 = Input, 1 = Output	R/W
31.F013.6	MPC Output Enable	This bit has no effect unless register 31.F015.11 = 1. 0 = Input, 1 = Output	R/W
31.F013.5	LED1 Output Enable	This bit has no effect unless register 31.F015.7 = 1. 0 = Input, 1 = Output	R/W
31.F013.4	LED0 Output Enable	This bit has no effect unless register 31.F015.3 = 1. 0 = Input, 1 = Output	R/W
31.F013.3	GPIO Output Enable	0 = Input, 1 = Output	R/W
31.F013.2	RX_LOS Output Enable	0 = Input, 1 = Output	R/W
31.F013.1	TX_FAULT Output Enable	0 = Input, 1 = Output	R/W
31.F013.0	MOD_ABS Output Enable	0 = Input, 1 = Output	R/W

### 3.6.3 GPIO Interrupts

When the pins are configured as input, several types of interrupt events can be generated. Registers 31.F014, 31.F015, and 31.F016 allow each pin to be configured to generate interrupt on 1 of 5 types of events:

- Low Level
- High Level
- High to Low Transition
- Low to High Transition
- Transitions on Either Edge

The interrupt generation can also be disabled.

When an interrupt event is generated, it is latched high in register 31.F011. The register bits will remain high until read.

The INT pin can be asserted when interrupt events occur. Register 31.F010 sets the interrupt enable. Registers 31.F010 and 31.F011 are bitwise AND together. If the result is non-zero, the INT pin will assert.

If any of the following occur, no new interrupt events will be generated and reported in register 31.F011 for that particular pin:

- When a pin is set to output
- When TX\_DISABLED, TOD, MPC, LED1, and LED0 are set to LED function instead of GPIO function
- When SCL and SDA are set to TWSI function instead of GPIO function

If a previous interrupt event occurred but is not read, the register will retain its value until read. In other words, if an interrupt event occurred while the pin is configured as an input, the interrupt status bit will be set. If subsequently the pin is set to an output, the interrupt status bit will remain set until it is read.

When changing a pin from output to input, an edge triggered event will not be generated on the transition. For example, if the pin is configured as an output and is driven low and there is a pull-up attached to the pin. Once the pin is configured as an input (to tri-state the pin), there will be a low to high transition. This low to high transition will not trigger an edge event. Subsequent transitions with the pin configured as input will trigger edge events.

See [Table 27](#), [Table 28](#), and [Table 29](#) for information on GPIO interrupt enable, status, and type.

**Table 27: GPIO Interrupt Enable**

Register	Function	Setting	Mode
31.F010.11	SCL Interrupt Enable	0 = Disable, 1 = Enable	R/W
31.F010.10	SDA Interrupt Enable	0 = Disable, 1 = Enable	R/W
31.F010.8	TX_DISABLED Interrupt Enable	0 = Disable, 1 = Enable	R/W
31.F010.7	TOD Interrupt Enable	0 = Disable, 1 = Enable	R/W
31.F010.6	MPC Interrupt Enable	0 = Disable, 1 = Enable	R/W
31.F010.5	LED1 Interrupt Enable	0 = Disable, 1 = Enable	R/W
31.F010.4	LED0 Interrupt Enable	0 = Disable, 1 = Enable	R/W
31.F010.3	GPIO Interrupt Enable	0 = Disable, 1 = Enable	R/W
31.F010.2	RX_LOS Interrupt Enable	0 = Disable, 1 = Enable	R/W
31.F010.1	TX_FAULT Interrupt Enable	0 = Disable, 1 = Enable	R/W
31.F010.0	MOD_ABS Interrupt Enable	0 = Disable, 1 = Enable	R/W

**Table 28: GPIO Interrupt Status**

Register	Function	Setting	Mode
31.F011.11	SCL Interrupt Status	This bit is not valid unless register 31.F016.15 = 1 and 31.F013.11 = 0. 0 = No Interrupt Occurred 1 = Interrupt Occurred	RO, LH
31.F011.10	SDA Interrupt Status	This bit is not valid unless register 31.F016.11 = 1 and 31.F013.10 = 0. 0 = No Interrupt Occurred 1 = Interrupt Occurred	RO, LH

31.F016.11	SDA Function	0 = SDA is used for TWSI Function. 1 = SDA is used for GPIO Function.	R/W
31.F016.10:8	SDA Select	Interrupt is effective only when 31.F013.10 = 0. Same as 31.F014.14:12	R/W
31.F016.4:3	TX_DISABLED Function	00 = TX_DISABLED is used for LED Function. 01 = TX_DISABLED is used for GPIO Function. 10 = TX_DISABLED controlled by 1.0009.4:0	R/W
31.F016.2:0	TX_DISABLED Select	Interrupt is effective only when 31.F013.8 = 0. Same as 31.F014.14:12	R/W

### 3.6.4 SFP Behavior

The behavior of TX\_DISABLE, RX\_LOS, and TX\_FAULT pins can be set to interact with the IEEE defined registers and PCS.

#### 3.6.4.1 TX\_DISABLE

When register 31.F016.4:3 of a port is set to 10, the TX\_DISABLE has the following behavior.

The TX\_DISABLE pin is configured as an output and writing to registers 31.F010.8, 31.F012.8, and 31.F013.8 has no effect.

If the PCS of port N is configured to 1000BASE-X or 10GBASE-R then

- TX\_DISABLE[N] pin is set high when port N register 1.0009.0 is set to 1 or 1.0009.1 is set to 1. Otherwise TX\_DISABLE[N] pin is set low.

Note that the PCS transmit path is also disabled when the transmit disable bits are set in register 1.0009.

### 3.6.4.2 RX\_LOS

When 31.F014.11 is set to 0 the RX\_LOS pin is configured as an input and writing to register 31.F013.2 has no effect. The RX\_LOS is used in conjunction with the receiver status of the lane to determine signal detect. Both the RX\_LOS and the receiver must detect a signal for signal detect to be up. When 31.F014.11 = 1, then RX\_LOS is not used to determine signal detect and only the receiver status of the lane is used to determine signal detect status.

Port N register 31.F012.2 will report the state of RX\_LOS[N], and 31.F011.2 will report the interrupt status of RX\_LOS[N] regardless of the setting of register 31.F014.11.

When register 31.F014.11 of a port is set to 0, the RX\_LOS has the following behavior that is dependent on the PCS.

If the PCS of port N is configured to 1000BASE-X or 10GBASE-R then

- RX\_LOS[N] pin is used for lane 0 signal detect, and port N register 1.000A.0 and 1.000A.1 reflects the signal detect status.

### 3.6.4.3 TX\_FAULT

When 31.F014.7 is set to 0, the TX\_FAULT pin is configured as an input and writing to register 31.F013.1 has no effect. The TX\_FAULT pin is used to determine the state of the transmit fault register 1.0008.11. When 31.F014.7 = 1, then register 1.0008.11 is always set to 0.

Port N register 31.F012.1 will report the state of TX\_FAULT[N], and 31.F011.1 will report the interrupt status of TX\_FAULT[N] regardless of the setting of register 31.F014.7.

When register 31.F014.7 of a port is set to 0, the TX\_FAULT has the following behavior that is dependent on the PCS.

If the PCS of port N is configured to 1000BASE-X or 10GBASE-R then

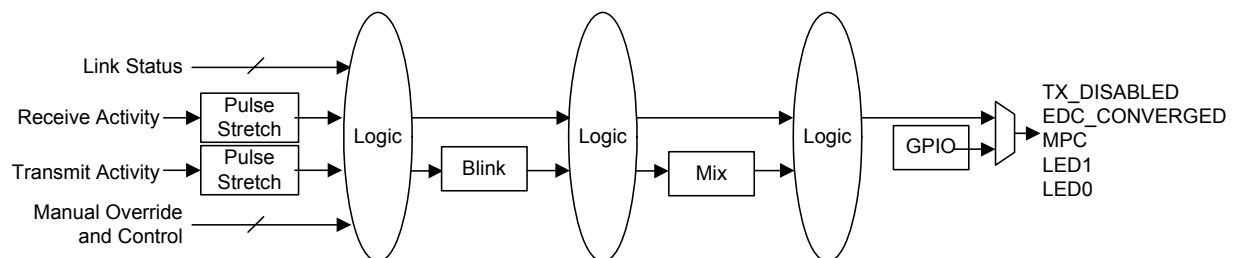

- Port N register 1.0008.11 is set to 1 when TX\_FAULT[N] is high. Otherwise register 1.0008.11 is set to 0.

## 3.7 LED

The TX\_DISABLED, TOD, MPC, LED1, and LED0 pins can be used to drive LED pins. Registers 31.F020 through 31.F027 control the operation of the LED pins. TX\_DISABLED, TOD, MPC, LED1, and LED0 will operate per this section unless the pin is used for GPIO purposes (see [Section 3.6, GPIO and SFP+](#), on page 48).

Figure 9 shows the general chaining of function for the LEDs. The various functions are described in the following sections. All LED pins are open drain outputs.

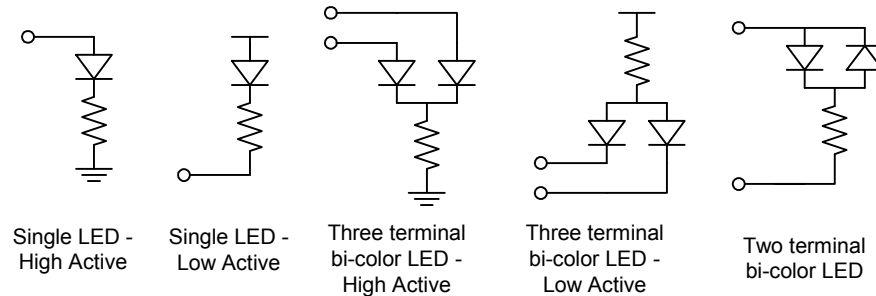

Figure 9: LED Chain

### 3.7.1 LED Polarity

There are a variety of ways to hook up the LEDs. Some examples are shown in [Figure 10](#). In order to make things more flexible registers 31.F020.1:0, 31.F021.1:0, 31.F022.1:0, 31.F023.1:0, and 31.F024.1:0 specify the output polarity for the LED function. The lower bit of each pair specifies the on (active) state of the LED, either high or low. The upper bit of each pair specifies whether the off state of the LED should be driven to the opposite level of the on state or Hi-Z.

**Figure 10: Various LED Hookup Configurations****Table 30: LED Polarity**

Register	LED Function	Definition
31.F020.1:0	LED0	00 = On - drive LED0 low, Off - drive LED0 high 01 = On - drive LED0 high, Off - drive LED0 low 10 = On - drive LED0 low, Off - tristate LED0 11 = On - drive LED0 high, Off - tristate LED0
31.F021.1:0	LED1	00 = On - drive LED1 low, Off - drive LED1 high 01 = On - drive LED1 high, Off - drive LED1 low 10 = On - drive LED1 low, Off - tristate LED1 11 = On - drive LED1 high, Off - tristate LED1
31.F022.1:0	MPC	00 = On - drive MPC low, Off - drive MPC high 01 = On - drive MPC high, Off - drive MPC low 10 = On - drive MPC low, Off - tristate MPC 11 = On - drive MPC high, Off - tristate MPC
31.F023.1:0	TOD	00 = On - drive TOD low, Off - drive TOD high 01 = On - drive TOD high, Off - drive TOD low 10 = On - drive TOD low, Off - tristate TOD 11 = On - drive TOD high, Off - tristate TOD
31.F024.1:0	TX_DISABLED	00 = On - drive TX_DISABLED low, Off - drive TX_DISABLED high 01 = On - drive TX_DISABLED high, Off - drive TX_DISABLED low 10 = On - drive TX_DISABLED low, Off - tristate TX_DISABLED 11 = On - drive TX_DISABLED high, Off - tristate TX_DISABLED

### 3.7.2 Pulse Stretching and Blinking

Register 31.F027.14:12 specifies the pulse stretching duration of a particular activity. Only the transmit activity, receive activity, and (transmit or receive) activity are stretched. All other statuses are not stretched since they are static in nature and no stretching is required.

Some status will require blinking instead of a solid on. Register 31.F027.10:8 and 31.F027.6:4 specifies the 2 blink rates. Note that the pulse stretching is applied first, and the blinking will reflect the duration of the stretched pulse.

Registers 31.F020.2, 31.F021.2, 31.F022.2, 31.F023.2, and 31.F024.2 select which of the 2 blink rates to use for LED0, LED1, MPC, TOD, and TX\_DISABLED respectively.

0 = Select Blink Rate 1

1 = Select Blink Rate 2

The stretched/blinked output will then be mixed if needed (see [Section 3.7.3, Bi-Color LED Mixing, on page 58](#)). For information on pulse stretching and blinking, see [Table 31](#).

**Table 31: Pulse Stretching and Blinking**

Register	LED Function	Definition
31.F027.14:12	Pulse stretch duration	000 = No pulse stretching 001 = 20 ms to 40 ms 010 = 40 ms to 81 ms 011 = 81 ms to 161 ms 100 = 161 ms to 322 ms 101 = 322 ms to 644 ms 110 = 644 ms to 1.3s 111 = 1.3s to 2.6s
31.F027.10:8	Blink Rate 2	000 = 40 ms 001 = 81 ms 010 = 161 ms 011 = 322 ms 100 = 644 ms 101 = 1.3s 110 = 2.6s 111 = 5.2s
31.F027.6:4	Blink Rate 1	000 = 40 ms 001 = 81 ms 010 = 161 ms 011 = 322 ms 100 = 644 ms 101 = 1.3s 110 = 2.6s 111 = 5.2s

### 3.7.3 Bi-Color LED Mixing

In the dual LED modes, the mixing function allows the 2 colors of the LED to be mixed to form a third color. Register 31.F026.7:4 control the amount to mix in the TOD and LED1 pins. Register 31.F026.3:0 controls the amount to mix in the MPC and LED0 pins. The mixing is determined by the percentage of time the LED is on during the active state. The percentage is selectable in 12.5% increments.

There are 2 types of bi-color LEDs: 3 terminal type, and 2 terminal type. For example, the third and fourth LED block from the left in [Figure 10](#) illustrate 3 terminal types, and the one on the far right in [Figure 10](#) illustrate 2 terminal type. In the 3 terminal type both of the LEDs can be turned on at the same time. Hence the sum of the percentage specified by 31.F026.7:4 and 31.F026.3:0 can exceed 100%. However, in the 2 terminal type, the sum should never exceed 100% since only 1 LED can be turned on at any given time.

The mixing only applies when register 31.F020.11:8 or 31.F022.11:8 are set to 101x. There is no mixing in single LED modes.

**Table 32: Bi-Color LED Mixing**

Register	LED Function	Definition
31.F026.7:4	TOD, LED1 mix percentage	0000 = 0% 0001 = 12.5% . . 0111 = 87.5% 1000 = 100% 1001 to 1111 = Reserved
31.F026.3:0	MPC, LED0 mix percentage	0000 = 0% 0001 = 12.5%, . . . 0111 = 87.5% 1000 = 100% 1001 to 1111 = Reserved

### 3.7.4 Modes of Operation

The LED pins relay various statuses of the PHY so that they can be displayed by the LEDs.

The statuses that the LEDs display is defined by registers 31.F020 to 31.F025 as shown in [Table 33](#). For each LED, if the condition selected by bits 11:8 is true, the LED will blink. If the condition selected by bits 7:4 is true, the LED will be solid on. If both selected conditions are true, the blink will take precedence.

**Table 33: LED Display**

Register	LED Function	Definition
31.F020.11:8	LED0 Blink Behavior	Blink Behavior has higher priority. 0000 = Solid Off 0001 = System-side Transmit or Receive Activity 0010 = System-side Transmit Activity 0011 = System-side Receive Activity 0100 = Reserved 0101 = Reserved 0110 = System-side Link 0111 = Solid On 1000 = Reserved 1001 = Reserved 1010 = Blink Mix 1011 = Solid Mix 11xx = Reserved
31.F020.7:4	LED0 Solid Behavior	Blink Behavior has higher priority. 0000 = Solid Off 0001 = System-side Transmit or Receive Activity 0010 = System-side Transmit Activity 0011 = System-side Receive Activity 0100 = Reserved 0101 = Reserved 0110 = System-side Link 0111 = Solid On 1xxx = Reserved
31.F021.11:8	LED1 Blink Behavior	Blink Behavior has higher priority. This register ignored if 31.F020.11:10 = 10 (Dual Mode). 0000 = Solid Off 0001 = Line-side Transmit or Receive Activity 0010 = Line-side Transmit Activity 0011 = Line-side Receive Activity 0100 = Reserved 0101 = Reserved 0110 = Line-side Link 0111 = Solid On 1xxx = Reserved
31.F021.7:4	LED1 Solid Behavior	Blink Behavior has higher priority. This register ignored if 31.F020.11:10 = 10 (Dual Mode). 0000 = Solid Off 0001 = Line-side Transmit or Receive Activity 0010 = Line-side Transmit Activity 0011 = Line-side Receive Activity 0100 = Reserved 0101 = Reserved 0110 = Line-side Link 0111 = Solid On 1xxx = Reserved

Table 33: LED Display (Continued)

Register	LED Function	Definition
31.F022.11:8	MPC Blink Behavior	Blink Behavior has higher priority. 0000 = Solid Off 0001 = System-side Transmit or Receive Activity 0010 = System-side Transmit Activity 0011 = System-side Receive Activity 0100 = Reserved 0101 = Reserved 0110 = System-side Link 0111 = Solid On 1000 = Reserved 1001 = Reserved 1010 = Blink Mix 1011 = Solid Mix 11xx = Reserved
31.F022.7:4	MPC Solid Behavior	Blink Behavior has higher priority. 0000 = Solid Off 0001 = System-side Transmit or Receive Activity 0010 = System-side Transmit Activity 0011 = System-side Receive Activity 0100 = Reserved 0101 = Reserved 0110 = System-side Link 0111 = Solid On 1xxx = Reserved
31.F023.11:8	TOD Blink Behavior	Blink Behavior has higher priority. This register ignored if 31.F022.11:10 = 10 (Dual Mode). 0000 = Solid Off 0001 = Line-side Transmit or Receive Activity 0010 = Line-side Transmit Activity 0011 = Line-side Receive Activity 0100 = Reserved 0101 = Reserved 0110 = Line-side Link 0111 = Solid On 1xxx = Reserved
31.F023.7:4	TOD Solid Behavior	Blink Behavior has higher priority. This register ignored if 31.F022.11:10 = 10 (Dual Mode). 0000 = Solid Off 0001 = Line-side Transmit or Receive Activity 0010 = Line-side Transmit Activity 0011 = Line-side Receive Activity 0100 = Reserved 0101 = Reserved 0110 = Line-side Link 0111 = Solid On 1xxx = Reserved

### 3.8 EEPROM Bridging and Polling

The 88X2222 device supports the ability to cache the contents of the EEPROM into an onboard RAM for faster read access. The device has the ability to periodically read the EEPROM and refresh the RAM. The 88X2222 device can also act as a bridge so that the EEPROM or other devices can be accessed via the MDC/MDIO interface of the PHY.

The EEPROM or external device is attached to the Two-wire Serial Interface (TWSI) via the SCL and SDA pins.

Register 1.8000.10 can be set to 1 to force the TWSI to reset.

**Figure 11: MDC/MDIO Bridging**

### 3.8.1 Bridging Function

The bridging function allows the contents of the EEPROM to be accessed directly via the MDC/MDIO. The access is through a series of reads and writes to the PHY register. Note that the access is not limited to the EEPROM but also to any device that is attached to the TWSI.

Since other devices may be connected to the TWSI where the slave address is not necessarily 1010xxx, there is a hook to access the TWSI device directly from the MDIO. Registers 1.8001, 1.8002, and 1.8003 give direct access between the MDIO and the TWSI.

**Table 34: EEPROM Address Register**

Register	Function	Setting	Mode
1.8001.15:9	Slave Address	Slave Address	R/W
1.8001.8	Read/Write	<p>A write to 1.8001 will initiate a read or write command on the TWSI if the TWSI is free otherwise the read or write command will be ignored.</p> <p>Make sure register 1.8002.10:8 is not equal to 010 (command in progress) prior to writing this register</p> <p>A read to 1.8001 will not trigger any action. Register 1.8003.7:0 must be set to the value to be written prior to issuing a write command.</p> <p>1 = Read, 0 = Write</p>	R/W
1.8001.7:0	Byte Address	Byte Address	R/W

**Table 35: EEPROM Read Data Register and EEPROM/RAM Status Register**

Register	Function	Setting	Mode
1.8002.12	Cache ECC Single Bit Corrected Interrupt Status	<p>0 = No single bit correction in ECC cache detected</p> <p>1 = Single bit correction in ECC cache detected</p>	RO, LH
1.8002.11	Cache ECC Uncorrectable Bit Interrupt Status	<p>0 = No uncorrectable bit in ECC cache detected</p> <p>1 = Uncorrectable bit in ECC cache detected</p>	RO, LH

**Table 35: EEPROM Read Data Register and EEPROM/RAM Status Register (Continued)**

Register	Function	Setting	Mode
1.8002.10:8	TWSI Status	<p>Register 1.8002.10:8 is the status in response to setting to writing register 1.8001.</p> <p>Register 1.8002.10:8 will remain at 010 until the command is completed. Once the command is completed, the status 001, 011, 100, 101, or 111 will remain until register 1.8002 is read. The register will clear on read.</p> <p>If a new command is issued by writing register 1.8001 without reading register 1.8002 for a previous command, the status of the previous command will be lost.</p> <p>If a command initiated by writing register 1.8001 is still in progress and a second command is issued, the status 1.8002.10:8 will reflect the first command.</p> <p>The second command is ignored but register 1.8002.10:8 will not be set to 111.</p> <p>Command Done - No Error is set when the TWSI slave properly responds with ACK.</p> <p>In the case of a write command with automatic read back, a Command Done - No Error status will be returned even if the read back data does not match the written data or if the TWSI slave does not respond with ACK during the read back.</p> <p>Register 1.8002.7:0 is valid only when register 1.8002.10:8 is set to 001.</p> <p>000 = Ready            001 = Command Done - No Error            010 = Command in Progress            011 = Write done but read back failed            100 = Reserved            101 = Command Failed            110 = Reserved            111 = two-wire interface Busy, Command Ignored</p>	RO, LH
1.8002.7:0	Read Data	<p>Read Data</p> <p>Register 1.8002.7:0 is valid only when register 1.8002.10:8 is set to 001.</p>	RO

**Table 36: EEPROM Write Data Register and EEPROM/RAM Control Register**

Register	Function	Setting	Mode
1.8003.15:12	Write Time	0000 = EEPROM takes 0 ms to write 0001 = 1.05 ms .... 1110 = 14.68 ms 1111 = 15.73 ms	R/W
1.8003.9	Automatic read back after write	If read back is enabled, then data will always be read back after a write. The read data is stored in register 1.8002.7:0 1 = Read back, 0 = No read back	R/W
1.8003.7:0	Write Data	Write Data	R/W

### 3.8.1.1 Read from TWSI Slave Device to the MDIO

When a read operation to the TWSI is required, the slave address and byte address is written to register 1.8001.15:9 and 1.8001.7:0 respectively with register 1.8001.8 set to 1 indicating read. Once register 1.8001 is written, a read operation on the TWSI commences only if the TWSI is free; otherwise, a read operation on the TWSI is never issued. The byte that is read is stored in register 1.8002.7:0. The status of the read operation is stored in register 1.8002.10:8.

While the read operation is pending register 1.8002.10:8 is set to 010. Once the read operation is completed and the TWSI slave sends all acknowledges register 1.8002.10:8 is set to 001 indicating the read operation completed without error. A 101 is returned if the read command is aborted when the TWSI slave does not acknowledge properly. A 111 is returned if the TWSI is busy when register 1.8001 was written.

Note that other than the 010 setting (command in progress) a read to 1.8002 will cause bits 10:8 to clear to 000.

### 3.8.1.2 Write from MDIO into the TWSI Slave Device

Write commands into the EEPROM are always available through the MDIO. If write access should be disabled, the EEPROM itself should be configured to ignore write commands from the 88X2222 device.

When a write operation to the TWSI is required, the byte data should first be written into 1.8003.7:0. The slave address and byte address is written to register 1.8001.15:9 and 1.8001.7:0 respectively with register 1.8001.8 set to 0 indicating write. Once register 1.8001 is written a write operation to the TWSI commences. If the read back bit is set in register 1.8003.9 then a read operation to the same address is performed after the write. The byte that is read is stored in register 1.8002.7:0. The status of the write operation is stored in register 1.8002.10:8.

While the write operation is pending register 1.8002.10:8 is set to 010. Once the write operation is completed and, optionally, the read back command and the TWSI slave sends all acknowledges, register 1.8002.10:8 is set to 001 indicating the write operation completed without error. A 011 is returned if the write operation is successfully completed but the read back command is aborted. A 101 is returned if the write command is aborted when the TWSI slave does not acknowledge properly. A 111 is returned if the TWSI is busy when register 1.8001 was written. Note that other than the 010 setting (command in progress) a read to 1.8002 will cause bits 10:8 to clear to 000.

Since it may take some time for the write to take effect in the external device, the 88X2222 device should wait for some amount of time as programmed in register 1.8003.15:12 after the write operation before issuing a read back command.

## 3.8.2 EEPROM Caching into RAM

The contents of the EEPROM or other device on the TWSI can be cached into on-chip memory. There are 2 segments of 128 bytes that can be cached. The first 128 byte segment is referred to as the A0 page and the second 128 byte segment is referred to as the secondary page.

Table 37, Table 38, and Table 39 list all the caching and polling registers. The A0 page always has a slave address of 1010000 and always reads the lower 128 bytes of the device. The A0 page control registers are located in 1.8000.1:0, the status registers located in 1.8000.3:2 and 1.8000.9, and the 128 bytes are stored in 1.8007 to 1.8086 bits 7:0.

The secondary page has similar registers located in 1.8000.12:11, 1.8000.14:13, 1.8000.15, and 1.8087 to 1.8106 bits 7:0 respectively. The only exception for the secondary page is that the slave address is not fixed and can be specified in 1.8004.7:1, and 18004.0 specifies whether the upper or lower 128 bytes of the device is read.

The caching sequence is not triggered at the de-assertion of hardware reset. Instead, the EEPROM is read, and RAM is loaded every time the MOD\_ABS pin makes a high to low transition. The caching sequence takes place after a delay specified by register 1.8004.15:13. The A0 page is cached on MOD\_ABS high to low transition only if 1.8000.1:0 is set to 01 or 10. The secondary page is similarly cached only if 1.8000.12:11 is set to 01 or 10. If caching is enabled for both pages, then page A0 is always loaded first.

Note that if the TWSI is active for any reason when the MOD\_ABS pin is triggered, the caching sequence will be deferred until the TWSI is inactive. If the TWSI is in the middle of a caching sequence initiated by the user (see below) the current caching sequence will be aborted after the completion of the active TWSI transaction and a new caching sequence is then started.

Either or both RAM caches are periodically updated if register 1.8000.1:0 and/or 1.8000.12:11 are set to 10. The update period is specified by register 1.8004.10:9. If both caches are to be updated the A0 page gets updated first. The polling will continue until it is disabled via registers 1.8000.1:0 or 1.8000.12:11. Alternatively, if the MOD\_ABS pin goes high, the polling will stop immediately after the TWSI transaction completes.

The contents of the EEPROM can be reloaded into RAM by writing register 1.8000.1:0 and/or 1.8000.12:11 to 11. These bits are self-clearing. If both 1.8000.1:0 and 1.8000.12:11 are set to 11 concurrently, the A0 page will be serviced first and, upon completion, 1.8000.1:0 will be cleared and then the secondary page will be serviced. Manual loading can be initiated regardless of the state of the MOD\_ABS pin. The result of the reload can be read via register 1.8000.3:2, 1.8000.9 or 1.8000.14:13, 1.8000.15.

All single byte read/write commands are deferred when initiated in the middle of an RAM update cycle.

Once the caching sequence is completed, the status register in 1.8000.3:2 or 1.8000.14:13 will be updated. Registers 1.8000.3:2 and 18000.14:13 are clear on read registers. After reading, the bits clear to 00. The status registers are updated according to the following priority.

1. If the entire 128 bytes have been updated successfully at least once since the last read to register 1.8000, then the status bits will be set to 01.
2. If all attempts to read the entire 128 bytes have failed since the last read to register 1.8000, then the status bits will be set to 11. A fail is defined to have occurred if any of the 128 byte reads return error.
3. If the circuit is in the middle of the first attempt to update the 128 bytes since the last read to register 1.8000, then the status will return 10.
4. If the circuit never made an attempt to update the 128 byte registers since the last read to register 1.8000, then the status will return 00.

Whenever MOD\_ABS pin transitions from 0 to 1 or whenever software or hardware reset is asserted, then 1.8000.9 and 1.8000.15 are set to 0s. If 1 successful caching sequence completes, then 1.8000.9 or 1.8000.15 will be set to a 1 and remains set until MOD\_ABS transitions from 0 to 1 or until a software or hardware reset is issued. Once the status bit is set to 1, it will remain set even if subsequent updates are not successful.

The maximum size EEPROM for each segment that can be handled is 128 bytes. The expected device type and device page selection in the slave address of the EEPROM is 1010000 for the A0 page. Any other value will result in the EEPROM not being read. Note that other pages can be read by setting registers 1.8004.7:1 and 1.8004.0.

The RAM can be access via reading Registers 1.8007 to 1.8086 bits 7:0 for the A0 page and 1.8087 to 1.8106 bits 7:0 for the secondary page.

The RAM is protected by an Error Correction Circuit (ECC) that generates 2 status signals, 1 to indicate a single bit error has been corrected and another to indicate uncorrectable bit errors. These 2 signals are used to generate interrupts. Registers 1.8004.12:11 are the interrupt enable bits and 1.8002.12:11 are the interrupt status bits. The interrupt status bits latch high when the status bits assert. The bits clear on read.

**Table 37: Caching and Polling Control and Status Register**

Register	Function	Setting	Mode
1.8000.15	Cache Valid Secondary Page	0 = Registers 1.8087 to 1.8106 invalid 1 = Registers 1.8087 to 1.8106 valid  This bit is set to 1 if at least 1 successful cache update is completed since hardware, software reset, or MOD0 transitions from 0 to 1. Use register 1.8000.14:13 for latest status.	RO
1.8000.14:13	Command Status Secondary Page	00 = Cache not updated since last read 01 = Contents in cache updated at least once since last read 10 = Cache is currently loading since last read 11 = All caching attempts since last read failed  This register clears on read. Register 1.8000.15 indicates whether the content of the cache is valid from any updates in the past.	RO, SC
1.8000.12:11	Cache Setting Secondary Page	00 = No automatic caching 01 = Cache once at module plugin 10 = Cache at module plugin and periodically poll 11 = Manual cache refresh  The page cached is selected by Register 1.8004.7:0	R/W
1.8000.10	TWSI Reset	0 = Normal operation 1 = Force TWSI circuit to reset	R/W, SC
1.8000.9	Cache Valid Page A0	0 = Registers 1.8007 to 1.8086 invalid 1 = Registers 1.8007 to 1.8086 valid  This bit is set to 1 if at least 1 successful cache update is completed since hardware, software reset, or MOD0 transitions from 0 to 1. Use register 1.8000.14:13 for latest status.	RO

**Table 37: Caching and Polling Control and Status Register (Continued)**

Register	Function	Setting	Mode
1.8000.3:2	Command Status Page A0	00 = Cache not updated since last read 01 = Contents in cache updated at least once since last read 10 = Cache is currently loading since last read 11 = All caching attempts since last read failed  This register clears on read. Register 1.8000.9 indicates whether the content of the cache is valid from any updates in the past.	RO, SC
1.8000.1:0	Cache Setting Page A0	00 = No automatic caching 01 = Cache once at module plugin 10 = Cache at module plugin and periodically poll 11 = Manual cache refresh  Page A0 lower 128 bytes are cached.	R/W

1.8007 to 8086.7:0	Page A0 EEPROM Byte	Byte (REGAD - 0x8007) Of EEPROM	RO
1.8087 to 8106.7:0	Secondary Page EEPROM Byte	Byte (REGAD - 0x8087) Of EEPROM	RO

**Note**

EEPROM caching is supported only for applications that do not require clock stretching.

## 3.9

### Interrupt

Various functional units in the device can generate interrupt on the INTn pin. INTn is pulled low when an enabled interrupt is active.

The interrupt status is reported upwards via 3 levels:

- First level (information purposes only) — Reports which port is generating an active interrupt
- Second level — Reports which function in the port is generating the interrupt
- Third level — Interrupt registers report the actual interrupt status

The third level interrupt status and the corresponding enables are described in the register sections for each function and in the following interrupt tree diagrams. The polarity of the interrupt can be controlled by Register 31.F421.

**Table 40: First-level Interrupt Status**

Register	Function	Setting
31.F420.7	Port M3 Interrupt Status	0 = No Interrupt 1 = Active Interrupt
31.F420.6	Port M2 Interrupt Status	0 = No Interrupt 1 = Active Interrupt
31.F420.5	Port M1 Interrupt Status	0 = No Interrupt 1 = Active Interrupt
31.F420.4	Port M0 Interrupt Status	0 = No Interrupt 1 = Active Interrupt
31.F420.2	Port N2 Interrupt Status	0 = No Interrupt 1 = Active Interrupt
31.F420.0	Port N0 Interrupt Status	0 = No Interrupt 1 = Active Interrupt

**Table 41: Second-level Interrupt Status**

Register	Function	Setting	Section Reference
31.F040.4	Reserved		
31.F040.3	GPIO Interrupt	0 = No Interrupt 1 = Active Interrupt	<a href="#">Section 3.6.3, GPIO Interrupts, on page 51</a>
31.F040.2	System-side PCS Interrupt	0 = No Interrupt 1 = Active Interrupt	<a href="#">Section 5.6, Traffic Generation and Checking, on page 96</a>
31.F040.0	Line-side PCS Interrupt	0 = No Interrupt 1 = Active Interrupt	<a href="#">Section 4.7, PRBS and Pattern Generators, on page 90</a>

**Table 42: Interrupt Polarity Control**

Register	Function	Setting
31.F421.2:1	Interrupt Polarity	00 = Active - drive INT low, Inactive - drive INT high 01 = Active - drive INT high, Inactive - drive INT low 10 = Active - drive INT low, Inactive - tri-state INT 11 = Active - drive INT high, Inactive - tri-state INT
31.F421.0	Force Interrupt Pin Active	0 = Normal operation 1 = Force interrupt pin active

## 3.10 Power Management

The chip can be globally set to be in the power down state after hardware reset. See [Section 3.4, Hardware Configuration, on page 46](#) on how to configure the device in the power down state.

The line and host can be manually powered down as described in [Section 4.5, Power Management, on page 88](#) and [Section 5.5, Power Management, on page 96](#) respectively.

They can also be powered up and down via a single write to register 31.F403.7:0. There are many registers that can be used to power down various blocks (for example, 31.F403.7:0 registers in [Section 4.5, Power Management, on page 88](#) and [Section 5.5, Power Management, on page 96](#)). All registers associated with a block must be powered for it to be active.

## 3.11 IEEE1149.1 and 1149.6 Controller

The IEEE 1149.1 standard defines a test access port and boundary-scan architecture for digital integrated circuits and for the digital portions of mixed analog/digital integrated circuits. The IEEE 1149.6 standard defines a test access port and boundary-scan architecture for AC coupled signals.

This standard provides a solution for testing assembled printed circuit boards and other products based on highly complex digital integrated circuits and high-density surface-mounting assembly techniques.

The 88X2222 device implements the instructions shown in [Table 43](#). Upon reset, ID\_CODE instruction is selected. The instruction opcodes are shown in [Table 43](#).

**Table 43: TAP Controller Opcodes**

Instruction	OpCode
EXTEST	0000_0000
SAMPLE/PRELOAD	0000_0001
CLAMP	0000_0010
HIGH-Z	0000_0011
ID_CODE	0000_0100
EXTEST_PULSE	0000_0101
EXTEST_TRAIN	0000_0110
AC_EXTEST	0000_0111
PROG_HYST	0000_1000
BYPASS	1111_1111

The 88X2222 device reserves 5 pins called the Test Access Port (TAP) to provide test access: Test Mode Select Input (TMS), Test Clock Input (TCK), Test Data Input (TDI), and Test Data Output (TDO), and Test Reset Input (TRSTn). To ensure race-free operation all input and output data is synchronous with the test clock (TCK). TAP input signals (TMS and TDI) are clocked into the test logic on the rising edge of TCK while output signal (TDO) is clocked on the falling edge. For additional details, refer to the IEEE 1149.1 Boundary Scan Architecture document.

### 3.11.1 BYPASS Instruction

The BYPASS instruction uses the bypass register. This register contains a single shift-register stage and is used to provide a minimum length serial path between the TDI and TDO pins of the 88X2222 device when test operation is not required. This arrangement allows rapid movement of test data to and from other testable devices in the system.

### 3.11.2 SAMPLE/PRELOAD Instruction

The SAMPLE/PRELOAD instruction enables scanning of the boundary-scan register without causing interference to the normal operation of the 88X2222 device. Two functions are performed when this instruction is selected: sample and preload.

Sample allows a snapshot to be taken of the data flowing from the system pins to the on-chip test logic or vice versa, without interfering with normal operation. The snapshot is taken on the rising edge of TCK in the Capture-DR controller state, and the data can be viewed by shifting through the component's TDO output.

While sampling and shifting data out through TDO for observation, preload enables an initial data pattern to be shifted in through TDI and to be placed at the latched parallel output of the boundary-scan register cells that are connected to system output pins. This step ensures that known data is driven through the system output pins upon entering the extest instruction. Without preload, indeterminate data would be driven until the first scan sequence is complete. The shifting of data for the sample and preload phases can occur simultaneously. While data capture is being shifted out, the preload data can be shifted in.

The boundary scan register for MIN[7] is closest to TDO.

Table 44 lists the boundary scan order where:

TDI → INTn → ... → MIN7] → TDO

### 3.11.3 EXTEST Instruction

The EXTEST instruction enables circuitry external to the 88X2222 device (typically the board interconnections) to be tested. Prior to executing the EXTEST instruction, the first test stimulus to be applied is shifted into the boundary-scan registers using the sample/preload instruction. Thus, when the change to the extest instruction takes place, known data is driven immediately from the 88X2222 to its external connections. Note that the SERDES output pins will be driven to static levels. The positive and negative legs of the SERDES output pins are controlled via a single boundary scan cell. The positive leg outputs the level specified by the boundary scan cell while the negative leg outputs the opposite level.

### 3.11.4 CLAMP Instruction

The CLAMP instruction enables the state of the signals driven from component pins to be determined from the boundary-scan register while the bypass register is selected as the serial path between TDI and TDO. The signals driven from the component pins do not change while the clamp instruction is selected.

### 3.11.5 HIGH-Z Instruction

The HIGH-Z instruction places all of the digital component system logic outputs in an inactive high-impedance drive state. In this state, an in-circuit test system may drive signals onto the connections normally driven by a component output without incurring the risk of damage to the component.

**Note**

The SERDES outputs cannot be tri-stated.

### 3.11.6 ID CODE Instruction

The ID CODE contains the manufacturer identity, part and version.

**Table 45: ID CODE Instruction**

Version	Part Number	Manufacturer Identity	Bit
Bit 31 to 28	Bit 27 to 12	Bit 11 to 1	Bit 0
0000	0000000000110011	00111101001	1

### 3.11.7 EXTEST\_PULSE Instruction

When the AC/DC select is set to DC, the EXTEST\_PULSE instruction has the same behavior as the EXTEST instruction.

When the AC/DC select is set to AC, the EXTEST\_PULSE instruction has the same behavior as the EXTEST instruction except for the behavior of the SERDES output pins.

As in the EXTEST instruction, the test stimulus must first be shifted into the boundary-scan registers. Upon the execution of the EXTEST\_PULSE instruction the SERDES positive output pins output the level specified by the test stimulus and SERDES negative output pins output the opposite level.

However, if the TAP controller enters into the Run-Test/Idle state the SERDES positive output pins output the inverted level specified by the test stimulus and SERDES negative output pins output the opposite level.

When the TAP controller exits the Run-Test/Idle state, the SERDES positive output pins again output the level specified by the test stimulus and SERDES negative output pins output the opposite level.

### 3.11.8 EXTEST\_TRAIN Instruction

When the AC/DC select is set to DC, the EXTEST\_TRAIN instruction has the same behavior as the EXTEST instruction.

When the AC/DC select is set to AC, the EXTEST\_TRAIN instruction has the same behavior as the EXTEST instruction except for the behavior of the SERDES output pins.

As in the EXTEST instruction, the test stimulus must first be shifted into the boundary-scan registers. Upon execution of the EXTEST\_PULSE instruction, the SERDES positive output pins output the level specified by the test stimulus and SERDES negative output pins output the opposite level.

However, if the TAP controller enters into the Run-Test/Idle state, the SERDES output pins will toggle between inverted and non-inverted levels on the falling edge of TCK. This toggling will continue for as long as the TAP controller remains in the Run-Test/Idle state.

When the TAP controller exits the Run-Test/Idle state, the SERDES positive output pins again output the level specified by the test stimulus and SERDES negative output pins output the opposite level.

### 3.11.9 AC-JTAG Fault Detection

The fault detection across AC coupled connections can be detected with a combination of (DC) EXTEST and any one of the AC JTAG commands. The AC coupled connection is shown in [Figure 19](#). The fault signature is shown in [Table 46](#).

- Column 1 lists the fault type.
- Columns 2 to 5 list the behavior when both the transmitter and receiver are running the EXTEST\_TRAIN and EXTEST\_PULSE commands.
  - Column 2 shows the expected value captured by the boundary scan cell that is connected to the test receiver, which is connected to the positive input when a negative differential pulse is transmitted.

- Column 3 is the same as column 2 except for the negative input.
- Columns 4 and 5 are similar to columns 2 and 3 except a positive differential pulse is transmitted.
- Columns 6 to 9 is similar to columns 2 to 5 except both the transmitter and receiver are running the (DC) EXTEST command.

While it is not possible to identify precisely which fault is occurring based on the fault signature, the signature to the no fault condition is unique when the (DC) EXTEST command is run with at least 1 of the EXTEST\_TRAIN, or EXTEST\_PULSE commands. Note that running only AC JTAG commands is not sufficient since the no fault condition signature is not distinguishable from the Tx to Rx short (see shaded cells in Table 46).

Figure 19: AC Coupled Connection

Table 46 provides details about the positive/negative legs for AC testing samples and (DC) EXTEST samples. In Table 46, the positive leg column is identified as +, and the negative leg column is identified as –.

Table 46: AC Coupled Connection Fault Signature

DC Coupled Fault	AC Testing Sample 0		AC Testing Sample 1		(DC) EXTEST Sample 0		(DC) EXTEST Sample 1	
	+	-	+	-	+	-	+	-
Tx+ Open	0	X	0	X	1	X	1	X
Tx- Open	X	0	X	0	X	1	X	1
Rx+ Open	0	X	0	X	1	X	1	X
Rx- Open	X	0	X	0	X	1	X	1
Tx+ short to power	0/Note 2	X	0/Note 2	X	1	X	1	X
Tx- short to power	X	0/Note 2	X	0/Note 2	X	1	X	1
Rx+ short to power	0/Note 2	X	0/Note 2	X	1	X	1	X
Rx- short to power	X	0/Note 2	X	0/Note 2	X	1	X	1
Tx+ short to ground	0	X	0	X	1	X	1	X
Tx- short to ground	X	0	X	0	X	1	X	1
Rx+ short to ground	0	X	0	X	0	X	0	X

NOTES:

1. Short on positive and negative leg can have several behavior on the test receiver. If both drivers cancel each other out then output on both legs is 0. If one driver dominates the other then both legs are either both 1 or both 0. In any case, the result is that both legs will have same value.
2. A solid short to power is assumed. If the short has high inductance then a pulse may still be sent at the receiver and will be mistaken as a good connection.

**Table 46: AC Coupled Connection Fault Signature (Continued)**

DC Coupled Fault	AC Testing Sample 0		AC Testing Sample 1		(DC) EXTEST Sample 0		(DC) EXTEST Sample 1	
	+	-	+	-	+	-	+	-
Rx- short to ground	X	0	X	0	X	0	X	0
Tx+ short to Tx-	Note 1	Note 1	Note 1	Note 1	1	1	1	1
Rx+ short to Rx-	Note 1	Note 1	Note 1	Note 1	1	1	1	1
Tx+ short to Rx-	X	0	X	1	X	0	X	1
Tx- short to Rx+	1	X	0	X	1	X	0	X
Tx+ short to Rx+	0	X	1	X	0	X	1	X
Tx- short to Rx-	X	1	X	0	X	1	X	0
No Fault	0	1	1	0	1	1	1	1

**NOTES:**

1. Short on positive and negative leg can have several behavior on the test receiver. If both drivers cancel each other out then output on both legs is 0. If one driver dominates the other then both legs are either both 1 or both 0. In any case, the result is that both legs will have same value.
2. A solid short to power is assumed. If the short has high inductance then a pulse may still be sent at the receiver and will be mistaken as a good connection.

The fault detection across DC coupled connections can be detected with any one of the AC JTAG or (DC) EXTEST commands. The DC coupled connection is shown in [Figure 20](#). The fault signature is shown in [Table 47](#).

**Figure 20: DC Coupled Connection**

In Table 47, the positive leg column is identified as +, and the negative leg column is identified as –.

**Table 47: DC Coupled Connection Fault Signature**

DC Coupled Fault	AC Testing Sample 0		AC Testing Sample 1		(DC) EXTEST Sample 0		(DC) EXTEST Sample 1	
	+	–	+	–	+	–	+	–

No Fault	0	1	1	0	0	1	1	0

**NOTES:**

1. Short on positive and negative leg can have several behaviors on the test receiver. If both drivers cancel each other out then output on both legs is 0. If one driver dominates the other then both legs are either both 1 or both 0. In any case, the result is that both legs will have same value.
2. A solid short to power is assumed. If the short has high inductance then a pulse may still be sent at the receiver and will be mistaken as a good connection.

## 3.12 Reference Clock

An external oscillator provides a reference for the on-board transmit Phase Lock Loop (PLL) and clock generation block that provides internal clocks for both the transmit and receive data paths. The clock input pins are CLKP/CLKN.

CLKP/CLKN runs on a 156.25 MHz differential clock. The FREQ\_SEL[1:0] should be set to 00.

## 3.13 Power Supplies

The 88X2222 device requires 3 power supplies: 1.5V (analog), 1.1V (analog), and 1.0V (digital).

If 1.2V, 1.8V, 2.5V, or 3.3V I/Os are required, then additional supplies will be required.

### 3.13.1 AVDD15

AVDD15\_N and AVDD15\_M are the 1.5V analog supplies.

### 3.13.2 AVDD11

AVDD11\_N is the 1.1V analog supply.

### 3.13.3 AVDD10

AVDD10\_M is the 1.0V analog supply.

### 3.13.4 DVDD

DVDD is the core logic 1.0V digital supply.

### 3.13.5 VDDO

There are 4 separate VDDO segments (VDDOT, VDDOS, VDDOL, and VDDOM). Each segment can be independently set to 1 for the following voltages: 1.2V, 1.5V, 1.8V, 2.5V, or 3.3V. Each VDDO segment has a corresponding voltage select configuration pin (VSEL\_T, VSEL\_S, VSEL\_L, and VSEL\_M). [Table 48](#) lists the signals under each of the VDDO segments.

If the VDDO\* segment is set to 1.2V, 1.5V, or 1.8V then its corresponding VSEL\_\* should tied to VDDO\*.

If the VDDO\* segment is set to 2.5V, or 3.3V then its corresponding VSEL\_\* should tied to VSS.

The input pins are not high voltage tolerant. For example if VDDOT is tied to 2.5V then RESETn should not be driven to 3.3V.

**Table 48: Signal Power Segment**

Power Segment	VDDOT	VDDOS	VDDOL	VDDOM
Voltage Select	VSEL_T	VSEL_S	VSEL_L	VSEL_M
<b>Signals</b>	FREQ_SEL[1:0]	LOS[3:0]	CONFIG[3:0]	INTn

# 4 Line-side Description

This section includes information on the following topics:

- [Section 4.1, Media Electrical Interface](#)
- [Section 4.2, PCS](#)
- [Section 4.3, Loopback](#)
- [Section 4.4, Synchronization FIFO](#)
- [Section 4.5, Power Management](#)
- [Section 4.6, Traffic Generation and Checking](#)
- [Section 4.7, PRBS and Pattern Generators](#)
- [Section 4.8, Interrupt](#)

The line-side interface is comprised of 2 differential input lanes NIP[0], NIP[2]/NIN[0], NIN[2], and 2 differential output lanes NOP[0], NOP[2]/NON[0], NON[2]. They can operate over multimode fiber, single mode fiber, and Twinax copper cables. The DSP engine overcomes the impairments of the fiber cable, optical front end, and electrical interconnect. In this document, each set of input/output lanes is referred to as lane N0 and N2.

These lanes can be arranged to form 2-ports of 1000BASE-X and 10GBASE-R.

## 4.1 Media Electrical Interface

The input and output buffers of the SERDES interface are internally terminated by 50Ω impedance (100Ω differential). No external terminations are required.

The SERDES transmitter uses a 3 tap (1 pre-tap and 1 post-tap) FIR filter that is implemented for the purpose of channel equalization. The FIR tap values can be manually adjusted to optimize the transmit eye over a particular channel.

The SERDES receiver contains a DSP-based Electronic Dispersion Compensation engine to perform clock and data recovery that significantly exceed the receiver performance specified by the 10GBASE-LRM standard. Advanced algorithms enables operation over multi-mode fiber.

The Electronic Dispersion Compensation can be disabled when not needed to trade performance versus power and latency.

## 4.2 PCS

Each port supports a multiple number of different PCS. [Section 3.1.2, PCS Operational Mode and Lane Attachment, on page 42](#) describes how to configure each port for the various PCS. This section focuses on the PCS itself.

### 4.2.1 10GBASE-R

The 10GBASE-R PCS is available on all ports. Lanes N0 and N2 are used by port 0 and 2 respectively. It is enabled by setting register 31.F002.14:8 to 0x71.

The 10GBASE-R PCS operates according to Clause 49 of the IEEE 802.3ae specification. The PCS uses a 64B/66B coding and scrambling to improve the transmission characteristics of the serial data and ease clock recovery at the receiver. The synchronization headers for 64B/66B code enable the receiver to achieve block alignment on the receive data. For details, refer to the IEEE 802.3 specification.

Figure 21: 10GBASE-R PCS

## 4.2.2 1000BASE-X

The 1000BASE-X PCS is available on all ports. Lanes N0 and N2 are used by port 0 and 2, respectively. There are several modes of 1000BASE-X. It is enabled by setting register 31.F002.14:8 to 1 for the following values.

- 0x7A = 1000BASE-X, 1000BASE-X Auto-Negotiation off
- 0x7B = 1000BASE-X, 1000BASE-X Auto-Negotiation on
- 0x7C = SGMII (system), SGMII Auto-Negotiation off
- 0x7D = SGMII (system), SGMII Auto-Negotiation on
- 0x7E = SGMII (media), SGMII Auto-Negotiation off
- 0x7F = SGMII (media), SGMII Auto-Negotiation on

### 4.2.2.1 PCS

The 1000BASE-X PCS operates according to Clause 36 of the IEEE 802.3 specification. The PCS uses a 8/10 bit coding for DC line balancing. For further details refer to the IEEE 802.3 specification.

The SGMII protocol is also supported over 1000BASE-X. The SGMII allows 10Mbps, 100Mbps, and 1000Mbps throughput over 1000BASE-X line coding.

When SGMII Auto-Negotiation is turned off (3.2000.12 = 0), the speed setting is programmed via register 3.2000 bits 13 and 6. Link is established when the underlying 1000BASE-X establishes link.

When SGMII Auto-Negotiation is turned on (3.2000.12 = 1) and the SGMII is set to the media side, the speed setting is programmed via register 3.2000 bits 13 and 6. This speed capability is advertised and Auto-Negotiations have to complete prior to link being established.

When SGMII Auto-Negotiation is turned on (3.2000.12 = 1) and the SGMII is set to the system side, the speed setting is determined by the Auto-Negotiation speed advertised by the link partner. Auto-Negotiations must be complete prior to link being established.

Although register 31.F002.14:8 can set the Auto-Negotiation to be on or off, that setting can be overridden by writing register 3.2000.12.

The SGMII mode is intended to be operated in pairs. In general, the port on the line side will be set to SGMII system while the attached port on the host side set to SGMII media, though it is possible to reverse this. If SGMII Auto-Negotiation is turned on, the Auto-Negotiation results on the SGMII system on the line side will be passed to the SGMII media on the host side which will in turn advertise the results.

### 4.2.2.2 1000BASE-X Auto-Negotiation

1000BASE-X Auto-Negotiation is defined in Clause 37 of the IEEE 802.3 specification. It is used to auto-negotiate duplex and flow control over fiber cable. Registers 3.2000, 3.2004, 3.2005, 3.2006, 3.2007, 3.2008, and 3.200F are used to enable Auto-Negotiation, advertise capabilities, determine link partner's capabilities, show Auto-Negotiation status, and show the duplex mode of operation respectively.

The device supports Next Page option for 1000BASE-X Auto-Negotiation. Register 3.2007 of the fiber pages is used to transmit Next Pages, and register 3.2008 of the fiber pages is used to store the received Next Pages. The Next Page exchange occurs with software intervention. The user must set Register 3.2004.15 to enable fiber Next Page exchange. Each Next Page received in the registers should be read before a new Next Page to be transmitted is loaded in Register 3.2007.

If the PHY enables 1000BASE-X Auto-Negotiation and the link partner does not, then the link cannot be established. The device implements an Auto-Negotiation bypass mode. See [Section 4.2.2.4, Auto-Negotiation Bypass Mode, on page 87](#) for details.

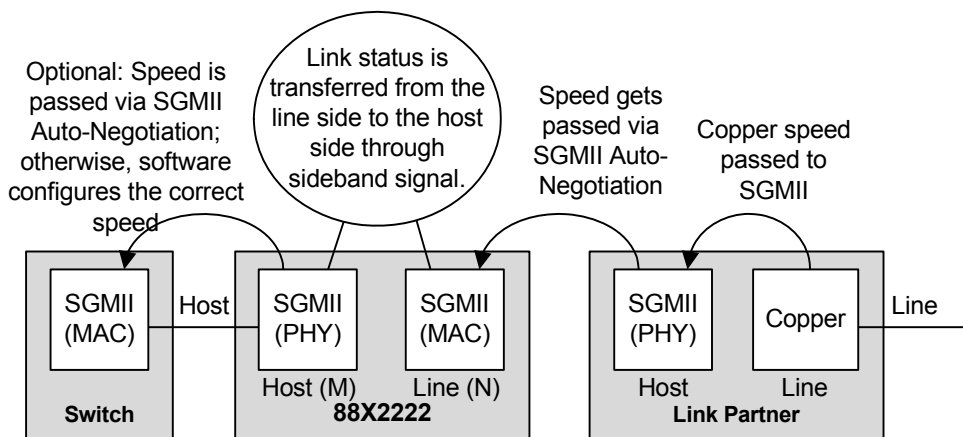

### 4.2.2.3 SGMII Auto-Negotiation

SGMII is a de-facto standard designed by Cisco. SGMII uses 1000BASE-X coding to send data as well as Auto-Negotiation information between the PHY and the MAC. However, the contents of the SGMII Auto-Negotiation are different than the 1000BASE-X Auto-Negotiation. See the "Cisco SGMII Specification" and the "MAC Interfaces and Auto-Negotiation" application note for further details.

The device supports SGMII with and without Auto-Negotiation. Auto-Negotiation can be enabled or disabled by writing to Register 3.2000.12 followed by a soft reset. If SGMII Auto-Negotiation is disabled, the MAC interface link, speed, and duplex status (determined by the media side) cannot be conveyed to the MAC from the PHY. The user must program the MAC with this information in some other way (for example, by reading PHY registers for link, speed, and duplex status).

The SGMII Auto-Negotiation information flow is shown in [Figure 22](#).

**Figure 22: SGMII Auto-Negotiation Information Flow**

#### 4.2.2.4 Auto-Negotiation Bypass Mode

If the MAC or the PHY implements the Auto-Negotiation function and the link partner does not, two-way communication is not possible unless Auto-Negotiation is manually disabled and both sides are configured to work in the same operational modes. To solve this problem, the device implements the SGMII Auto-Negotiation Bypass Mode. When entering the state “Ability\_Detect”, a bypass timer begins to count down from an initial value of approximately 200 ms. If the device receives idles during that 200 ms, the device will interpret that the other side is “alive” but cannot send configuration codes to perform Auto-Negotiation. After the 200 ms timeframe, the state machine will move to a new state called “Bypass\_Link\_Up” in which the device assumes a link-up status and the operational mode is set to the value listed under the Comments column of [Table 49](#).

**Table 49: SGMII Auto-Negotiation Modes**

Reg. 3.2000.12	Reg. 3.A000.13	Comments
0	X	No Auto-Negotiation. The user is responsible for determining speed, link, and duplex status by reading PHY registers.
1	0	Normal SGMII Auto-Negotiation. Speed, link, and duplex status automatically communicated to the MAC during Auto-Negotiation.
1	1	MAC Auto-Negotiation enabled. Normal operation.
		MAC Auto-Negotiation disabled. After 200 ms the PHY will disable Auto-Negotiation and link based on idles.

### 4.3 Loopback

The line-side SERDES support 2 loopback paths.

If register 3.F003.12 = 1, then data from the line will loopback to the line as shown in [Figure 23](#).

**Figure 23: Shallow Line Loopback**

Registers 2.0000.14, 3.0000.14, 3.1000.14, 3.2000.14, and 3.3000.14 are physically the same bit. If any of these bits are set to 1, then data from the core will loopback to the core as shown in [Figure 24](#) and [Figure 25](#). If register 3.F003.6 = 0, then the egress path will not be blocked as shown in [Figure 24](#). If register 3.F003.6 = 1, then the egress path will be blocked as shown in [Figure 25](#).

**Figure 24: Deep Host Loopback, No Egress Blocking****Figure 25: Deep Host Loopback, Egress Blocking**

## 4.4 Synchronization FIFO

Each port has a transmit synchronizing FIFOs to reconcile frequency differences between the clocks of the internal bus and the clock used to transmit data onto the media interface. The depth of the FIFO can be programmed by setting Register 3.F00C.15:14.

The FIFO depths can be increased in length to support longer frames. The device has settings for maximum frame sizes of 10 Kb, 20 Kb, 40 Kb, and 80 Kb with up to  $\pm 100$  ppm clock jitter in 10 Gbps operation and 10 Kb, 15 Kb, 20 Kb, and 25 Kb with up to  $\pm 100$  ppm clock jitter in 1 Gbps operation. The deeper the FIFO depth, the higher the latency will be.

The FIFO overflow/underflow status is reported in Register 3.F00B.1:0.

## 4.5 Power Management

The 88X2222 device will automatically power down unused circuits. The media side can be forced into a power down state by setting 1.0000.11, 2.0000.11, 3.0000.11, 3.1000.11, 3.2000.11, or 3.3000.11 to 1. Note that these power down registers are physically the same bit even though they reside in different locations. Port level register, 31.F003.14 can also be used to power down the media side. Since 31.0xF003.14 is physically a separate register bit, setting this bit won't be reflected into PCS power down bits as previously mentioned, but will override them.

To soft reset the media side set registers 1.0000.15, 2.0000.15, 3.0000.15, 3.1000.15, 3.2000.15, 3.3000.15, or 7.0000.15 to 1. Register 31.F003.15 can also be used to soft reset the media side. These software reset registers are physically the same bit even though they reside in different locations.

## 4.6 Traffic Generation and Checking

This section describes the Generator/Checker functions. All counters are 48 bits long. If Register 3.F010.14 is set to 1, the counters clear on read. If Register 3.F010.14 is set to 0, the counters will keep counting until 3.F010.6 is set to 1 to clear the contents.

### 4.6.1 Packet Generator

A packet generator enables the device to generate traffic onto the media without the need to receive data from the host.

Register 3.F010.1 enables the internal packet generator.

Register 3.F016 specifies the number of bytes in the packet that is to be generated. This count includes the frame bytes but does not include the 4-byte CRC (unless it is appended - Register 3.F011.3 = 0), the terminate symbol, nor the 8 preamble bytes. If the register is set to 0x0000 then the length will be randomly selected between 64 to 1518 bytes. If the register is set to 0x0001 then the length will be randomly selected to be between 64 to 0x0FFF bytes, 0x0002 then 64 to 0x1FFF bytes, 0x0003 then 64 to 0x3FFF bytes, 0x0004 then 64 to 0x7FFF bytes, 0x0005 then 64 to 0xFFFF bytes. If 0x0008 to 0xFFFF then the number of bytes transmitted is fixed from 8 to 0xFFFF.

Register 3.F017 specifies the number of packets to burst. 0x0000 means stop generation, 0xFFFF means continuously generate packets, 0x0001 to 0xFFFE means send a burst of 1 to 0xFFFE packets.

Register 3.F018 specifies the gap between packets. Each increment in the value increases the idle time by 4 bytes. 3.F018.14:0 specifies the upper limit of the gap. If 3.F018.15 is 0, then the lower limit for IPG is also specified by 3.F018.14:0. Otherwise a random gap between  $1 \times 4$  bytes to  $3.F018.14:0 \times 4$  bytes will be used. For the purposes of counting IPG all lanes must be idle for it to be counted as an IPG; that is, if the terminate symbol is in the XGMII word, then it does not count towards the IPG.

Register 3.F012 and 3.F013 specifies the initial value of the payload or the fixed value of the payload. The 4 bytes in this register corresponds to the first 4 bytes of the frame. Register 3.F011.7:4 specifies the behavior of the payload.

When 3.F011.7:4 = 000x, then registers 3.F012 and 3.F013 are used as the payload repeatedly.

When 3.F011.7:4 = 0010, then registers 3.F012 and 3.F013 are used as the payload repeatedly but every other XGMII word should be inverted. That is, a payload of 034EA675 will result in a sequence of 034EA675, FCB1598A, 034EA675, FCB1598A, ....

When 3.F011.7:4 = 0011, then registers 3.F012 and 3.F013 are used as the payload repeatedly but inverted every second XGMII word. That is, a payload of 034EA675 will result in a sequence of 034EA675, 034EA675, FCB1598A, FCB1598A, 034EA675, 034EA675, FCB1598A, FCB1598A, ....

When 3.F011.7:4 = 0100, then registers 3.F012 and 3.F013 are used as the initial value and each byte subsequently bitwise left shifted. That is, a payload of 034EA675 will result in a sequence of 034EA675, 069C4DEA, 0C399AD5, 187235AB, ....

When 3.F011.7:4 = 0101, then registers 3.F012 and 3.F013 are used as the initial value and each byte subsequently bitwise right shifted.

When 3.F011.7:4 = 0110, then registers 3.F012 and 3.F013 are used as the initial value and the 32 bits subsequently bitwise left shifted. That is, a payload of C34EA675 will result in a sequence of C34EA675, 869D4CEB, 0D3A99D7, 1A7533AE, ....

When 3.F011.7:4 = 0111, then registers 3.F012 and 3.F013 are used as the initial value and the 32 bits subsequently bitwise right shifted.

When 3.F011.7:4 = 1000, then registers 3.F012 and 3.F013 are used as the initial value and subsequently byte-wise incremented. That is, a payload of FFFE0055 will result in a sequence of FFFE0055, 00FF0156, 01000257, 02010358, ....

When 3.F011.7:4 = 1001, then registers 3.F012 and 3.F013 are used as the initial value and subsequently bitwise decremented.

When 3.F011.7:4 = 1010, then registers 3.F012 and 3.F013 are ignored and a pseudo random payload is generated. All 4 bytes are the same value for each cycle.

When 3.F011.7:4 = 1011, then registers 3.F012 and 3.F013 are ignored and a pseudo random payload is generated. All 4 bytes are randomly generated for each cycle.

At the start of each packet registers 3.F012 and 3.F013 should be used to reset the initial values to ensure that the pattern in the packet is the same when repeated over and over many times. The only time that the pattern in the packet will be different is when pseudo-random generation is selected.

For each packet generated the 48-bit counter in 3.F01B, 3.F01C, and 3.F01D is incremented by 1.

For each byte generated the 48-bit counter in 3.F01E, 3.F01F, and 3.F020 is incremented by 1. Preamble bytes are not counted but CRC bytes are counted.

Register 3.F011.3 controls whether the CRC is generated or not.

## 4.6.2 Checker

The CRC checker is enabled by setting Register 3.F010.0 to 1.

If Register 3.F010.2 = 0, then the checker will wait until the start of frame delimiter (SFD) is detected to detect the frame boundary.

If Register 3.F010.2 = 1, then the checker will assume the first 8 bytes of the packet is the preamble and the frame starts at the ninth byte of the packet.

There are 3 sets of 48-bit counters for the checker.

- Registers 3.F021, 3.F022, 3.F023 is the receive packet counter.
- Register 3.F027, 3.F028, and 3.F029 is the receive packet error counter.
- Register 3.F024, 3.F025, and 3.F026 is the receive byte counter.

The receive packet counter counts the number of packets received regardless of whether there is a CRC error. The receive packet error counter increments once per packet with a CRC error. The byte counter counts the number of bytes in the frame including the CRC. The preamble bytes are not counted.

## 4.7 PRBS and Pattern Generators

The device supports various IEEE defined and proprietary PRBS generators and checkers, and transmit waveform pattern generators. Only 1 generator/checker may be enabled at a time per lane. Unpredictable results may occur if multiple generators are enabled simultaneously.

### 4.7.1 General PRBS Generators and Checkers

Each lane has its own general PRBS generator and checker. Port 0 registers controls lane 0, port 1 controls lane 1, port 2 controls lane 2, and port 3 controls lane 3.

Register 3.F030 controls the generator and checker. Setting register 3.F030.5 to 1 enables the generator, and setting register 3.F030.4 to 1 enables the checker. If either of these bits is set to 1, the general PRBS generator and checker overrides the PCS specific generators and checkers.

Register 3.F030.3:0 controls the pattern that is generated and checked. There is no checker for the high frequency, low frequency, mixed frequency, and square wave patterns as there are waveforms to check the transmitter performance.

0000 = IEEE 49.2.8 - PRBS 31

0001 = PRBS 7

0010 = PRBS 9 IEEE 83.7  
0011 = PRBS 23  
0100 = PRBS 31 Inverted  
0101 = PRBS 7 Inverted  
1000 = PRBS 15  
1001 = PRBS 15 Inverted  
0110 = PRBS 9 Inverted  
0111 = PRBS 23 Inverted  
1100 = High frequency pattern  
1101 = Low frequency pattern  
1110 = Mixed frequency pattern  
1111 = Square Wave pattern

All counters are 48 bits long. If register 3.F030.13 is set to 1 then the counters will clear on read. If register 3.F030.13 is set to 0 then the counters will keep counting until register 3.F030.6 is set to 1 to clear the contents. If register 3.F030.7 is set to 0, then the PRBS counters will not start to count until the checker first locks onto the incoming PRBS data. If register 3.F030.7 is set to 1 then the PRBS checker will start counting errors without first locking to the incoming PRBS data. Register 3.F030.8 indicates whether the PRBS checker has locked.

All 48-bit counters are formed by 3 16-bit registers. The lowest addressed register is the least significant 16 bits and the highest addressed register is the most significant 16 bits of the counter. When the least significant register is read, the 2 upper registers are updated and frozen so that the 3 register read is atomic. Note that it is not necessary to read the upper registers. However upon subsequent reads of the least significant register, the values of the upper registers from the previous reads are lost. In order to get the correct upper register value the least significant register must be read first.

Register 3.F031, 3.F032, and 3.F033 is the transmit bit counter. Register 3.F034, 3.F035, and 3.F036 is the receive bit counter. Register 3.F037, 3.F038, and 3.F039 is the receive bit error counter.

## 4.7.2 10GBASE-R Specific Generators and Checkers

Registers 3.002A.4 and 3.002A.5 when set to 1 enables the PRBS31 generator and checker respectively. Register 3.002A.3 and 3.002A.2 when set to 1 enables the transmit and receive test patterns respectively. Register 3.002A.1 selects the test pattern. The error counter is in register 3.002B.15:0 and clears on read.

## 4.8 Interrupt

The Line PCS supports several interrupts. The interrupt enable, interrupt status, and real time status are shown in [Table 50](#).

The INTn interrupt pin will be active if any of the events enabled in the interrupt enable register occurs. If an interrupt event corresponding to a disabled interrupt enable bit occurs, the corresponding interrupt status bit will be set even though the event does not activate the INTn pin. The interrupts are cleared after a read to the interrupt status register.

**Table 50: Interrupt Registers**

Type	Interrupt Enable	Interrupt Status	Real Time Status
10GBASE-R	3.8000	3.8001	3.8002
1000BASE-X	3.A001	3.A002	3.A003
Misc	3.F00A	3.F00B	

# 5 Host-side Description

This section includes information on the following topics:

- [Section 5.1, Host Electrical Interface](#)
- [Section 5.2, PCS](#)
- [Section 5.3, Loopback](#)
- [Section 5.4, Synchronizing FIFO](#)
- [Section 5.5, Power Management](#)
- [Section 5.6, Traffic Generation and Checking](#)
- [Section 5.7, PRBS and Pattern Generators](#)
- [Section 5.8, Interrupt](#)

The host-side interface is comprised of 8 differential input lanes MIP[7:0]/MIN[7:0] and 8 differential output lanes MOP[7:0]/MON[7:0]. They are designed to operate over short backplanes to the host device. In this document, each set of input / output lanes is referred to as lane M0, M1, M2, M3, M4, M5, M6, and M7.

These lanes can be arranged to form 4-ports of 1000BASE-X, 10GBASE-R, and RXAUI, and 2-ports of XAUI.

## 5.1 Host Electrical Interface

The input and output buffers of the SERDES interface are internally terminated by 50Ω impedance (100Ω differential). No external terminations are required.

The SERDES transmitter uses a 3 tap (1 pre-tap and 1 post-tap) FIR filter that is implemented for the purpose of channel equalization. The FIR tap can be manually adjusted to optimize the transmit eye over a particular channel.

The receiver performs clock and data recovery and de-serializes the data.

## 5.2 PCS

Each port supports a multiple number of different PCS. [Section 3.1.2, PCS Operational Mode and Lane Attachment, on page 42](#) describes how to configure each port for the various PCS. This section focuses on the PCS itself.

### 5.2.1 10GBASE-R

The 10GBASE-R PCS is available on all ports. It is enabled by setting register 31.F002.6:0 to 0x71.

If register 31.F402.9 is set to 1, then lanes M0 through M3 are used by port 0 through 3 respectively.

If register 31.F402.9 is set to 0, then lanes M0, M2, M4, M6 are used by port 0 through 3 respectively.

In all other respects the 10GBASE-R functionality is identical to [Section 4.2.1, 10GBASE-R, on page 84](#) except the DEVAD is 4 instead of 3.

### 5.2.2 XAUI

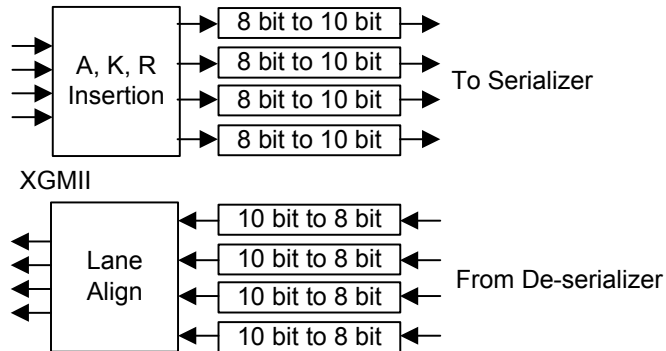

The XAUI PCS is available only on ports 0 and 2. It is enabled by setting register 31.F002.6:0 to 0x73.

Normally lanes M0 to M3 are used by port 0 and correspond to lanes 0 to 3, and lanes M4 to M7 are used by port 2 and corresponds to lanes 4 to 7. However, if register 4.9000.7 is set to 1, then the lane order will be reversed with lanes M3 to M0 used by port 0 and corresponding to lanes 0 to 3, and lanes M7 to M4 are by port 2 and corresponding to lanes 4 to 7. The reverse lane order configuration only applies to the PCS. Access for all PMA registers is not lane reversed.

The XAUI PCS operates according to Clause 48 of the IEEE 802.3ae specification. The PCS uses a 8/10-bit coding across 4 lanes for DC line balancing. For details, see the IEEE 802.3 specification.

**Figure 26: XAUI PCS**

### 5.2.3 1000BASE-X

The 1000BASE-X PCS is available on all ports. There are several modes of 1000BASE-X.

It is enabled by setting register 31.F002.6:0 to 1 of the following values.

- 0x7A = 1000BASE-X, 1000BASE-X Auto-Negotiation off
- 0x7B = 1000BASE-X, 1000BASE-X Auto-Negotiation on
- 0x7C = SGMII (system), SGMII Auto-Negotiation off
- 0x7D = SGMII (system), SGMII Auto-Negotiation on
- 0x7E = SGMII (media), SGMII Auto-Negotiation off
- 0x7F = SGMII (media), SGMII Auto-Negotiation on

If register 31.F402.8 is set to 1, then lanes M0 through M3 are used by port 0 through 3 respectively.

If register 31.F402.8 is set to 0, then lanes M0, M2, M4, M6 are used by port 0 through 3 respectively.

In all other respects the 1000BASE-X functionality is identical to [Section 4.2.2, 1000BASE-X, on page 85](#) except the DEVAD is 4 instead of 3.

## 5.3 Loopback

The host-side SERDES supports 2 loopback paths.

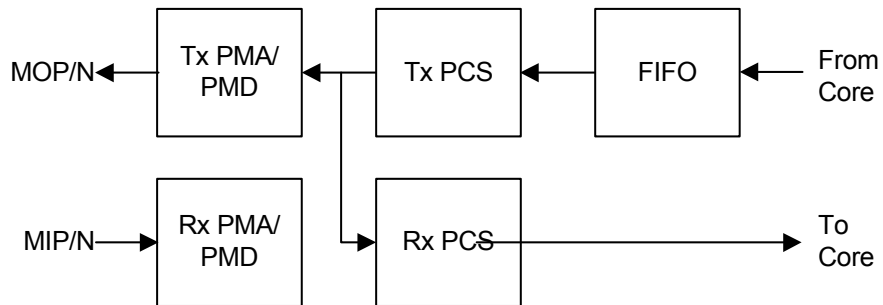

If register 4.F003.12 = 1 then data from the host will loopback to the host as shown in [Figure 27](#).

**Figure 27: Shallow Host Loopback**

Registers 4.0000.14, 4.1000.14, 4.2000.14, and 4.3000.14 are physically the same bit. If any of these bits are set to 1, then data from the core will loopback to the core as shown in [Figure 28](#) and [Figure 29](#). If register 4.F003.6 = 0, then the ingress path will not be blocked as shown in [Figure 28](#). If register 4.F003.6 = 1, then the ingress path will be blocked as shown in [Figure 29](#).

**Figure 28: Deep Line Loopback, No Ingress Blocking**

**Figure 29: Deep Line Loopback, Ingress Blocking**

## 5.4 Synchronizing FIFO

Each port has a transmit synchronizing FIFOs to reconcile frequency differences between the internal bus clocks and the clock used to transmit data onto the host interface. The depth of the FIFO can be programmed by setting register 4.F00C.15:14.

The FIFO depths can be increased in length to support longer frames. The device has settings for maximum frame sizes of the following:

- 10 Kb, 20 Kb, 40 Kb, and 80 Kb with up to  $\pm 100$  ppm clock jitter in 10 Gbps operation and
- 10 Kb, 15 Kb, 20 Kb, and 25 Kb with up to  $\pm 100$  ppm clock jitter in 1 Gbps operation

The deeper the FIFO depth is, the higher the latency will be.

The FIFO overflow/underflow status is reported in register 4.F00B.1:0.

## 5.5 Power Management

The 88X2222 device will automatically power down unused circuits. The host side can be forced into a power down state by setting 4.0000.11, 4.1000.11, 4.2000.11, or 4.3000.11 to 1. Register 31.0xF003.6 can also be used to power down the host-side port. These power down registers are physically the same bit even though they reside in different locations. Since 31.0xF003.6 is physically a separate register bit, setting this bit will not be reflected into PCS power down bits previously mentioned, but will override them.

To soft reset only the host side, set registers 4.0000.15, 4.1000.15, 4.2000.15, or 4.3000.15. Register 31.F003.7 can also be used to soft reset the host side. These software reset registers are physically the same bit even though they reside in different locations.

## 5.6 Traffic Generation and Checking

This section describes the generator and checker functions. All counters are 48 bits long. If register 4.F010.14 is set to 1, the counters clear on read. If register 4.F010.14 is set to 0, then the counters will keep counting until 4.F010.6 is set to 1 to clear the contents.

### 5.6.1 Packet Generator

A packet generator enables the device to generate traffic onto the host without the need to receive data from the media.

Register 4.F010.1 enables the internal packet generator.

Register 4.F016 specifies the number of bytes in the packet that is to be generated. This count includes the frame bytes but does not include the 4 byte CRC (unless it is appended - register 4.F011.3 = 0), the terminate symbol, nor the 8 preamble bytes. The length depends upon the register setting:

- If the register is set to 0x0000, then the length will be randomly selected between 64 to 1518 bytes.
- If the register is set to 0x0001, then the length will be randomly selected to be between 64 to 0x0FFF bytes.
- If the register is set to 0x0002, then the length will be 64 to 0x1FFF bytes,
- If the register is set to 0x0003, then the length will be 64 to 0x3FFF bytes,
- If the register is set to 0x0004, then the length will be 64 to 0x7FFF bytes,
- If the register is set to 0x0005, then the length will be 64 to 0xFFFF bytes.
- If the register is set to 0x0008 to 0xFFFF, then the number of bytes transmitted is fixed from 8 to 0xFFFF.

Register 4.F017 specifies the number of packets to burst. 0x0000 means stop generation, 0xFFFF means continuously generate packets, 0x0001 to 0xFFFFE means send a burst of 1 to 0xFFFFE packets.

Register 4.F018 specifies the gap between packets. Each increment in the value increases the idle time by 4 bytes. 4.F018.14:0 specifies the upper limit of the gap. If 4.F018.15 is 0 then the lower limit for IPG is also specified by 4.F018.14:0; otherwise, a random gap between 1 x 4 bytes to 4.F018.14:0 x 4 bytes will be used. For the purposes of counting IPG all lanes must be idle for it to be counted as an IPG. In other words if the terminate symbol is in the XGMII word then it does not count towards the IPG.

Register 4.F012 and 4.F013 specifies the initial value of the payload or the fixed value of the payload. The 4 bytes in this register corresponds to the first 4 bytes of the frame. Register 4.F011.7:4 specifies the behavior of the payload.

When 4.F011.7:4 = 000x then registers 4.F012 and 4.F013 are used as the payload repeatedly.

When 4.F011.7:4 = 0010 then registers 4.F012 and 4.F013 are used as the payload repeatedly but every other XGMII word should be inverted. That is, a payload of 034EA675 will result in a sequence of 034EA675, FCB1598A, 034EA675, FCB1598A, ....

When 4.F011.7:4 = 0011 then registers 4.F012 and 4.F013 are used as the payload repeatedly but inverted every second XGMII word. That is, a payload of 034EA675 will result in a sequence of 034EA675, 034EA675, FCB1598A, FCB1598A, 034EA675, 034EA675, FCB1598A, FCB1598A, ....

When 4.F011.7:4 = 0100 then registers 4.F012 and 4.F013 are used as the initial value and each subsequent byte is shifted left bitwise. That is, a payload of 034EA675 will result in a sequence of 034EA675, 069C4DEA, 0C399AD5, 187235AB, ....

When 4.F011.7:4 = 0101 then registers 4.F012 and 4.F013 are used as the initial value and each subsequent byte is shifted right bitwise.

When 4.F011.7:4 = 0110 then registers 4.F012 and 4.F013 are used as the initial value and the subsequent 32 bits are shifted left bitwise. That is, a payload of C34EA675 will result in a sequence of C34EA675, 869D4CEB, 0D3A99D7, 1A7533AE, ....

When 4.F011.7:4 = 0111 then registers 4.F012 and 4.F013 are used as the initial value and the subsequent 32 bits are shifted right bitwise.

When 4.F011.7:4 = 1000, registers 4.F012 and 4.F013 are used as the initial value and subsequently bitwise incremented. That is, a payload of FFFE0055 will result in a sequence of FFFE0055, 00FF0156, 01000257, 02010358, ....

When 4.F011.7:4 = 1001, registers 4.F012 and 4.F013 are used as the initial value and subsequently bitwise decremented.

When 4.F011.7:4 = 1000, registers 4.F012 and 4.F013 are ignored and a pseudo random payload is generated. All 4 bytes are the same value for each cycle.

When 4.F011.7:4 = 1001 then registers 4.F012 and 4.F013 are ignored and a pseudo random payload is generated. All 4 bytes are randomly generated for each cycle.

At the start of each packet registers 4.F012 and 4.F013 should be used to reset the initial values to ensure that the pattern in the packet is the same when repeated many times. The only time that the pattern in the packet will be different is when pseudo random generation is selected.

The following 48-bit counters are incremented by 1:

- For each packet generated, 4.F01B, 4.F01C, and 4.F01D
- For each byte generated, 4.F01E, 4.F01F, and 4.F020

Preamble bytes are not counted but CRC bytes are counted.

Register 4.F011.3 controls whether the CRC is generated or not.

## 5.6.2 Checker

The CRC checker is enabled by setting register 4.F010.0 to 1.

If register 4.F010.2 = 0, the checker will wait until the SFD is detected to detect the frame boundary.

If register 4.F010.2 = 1, the checker will assume the first 8 bytes of the packet is the preamble and the frame starts at the ninth byte of the packet.

There are 3 sets of 48-bit counters for the checker:

- Receive packet counter
  - Registers 4.F021, 4.F022, 4.F023
  - Counts the number of packets received regardless of whether there is a CRC error
- Receive packet error counter
  - Registers 4.F027, 4.F028, and 4.F029
  - Increments once per packet with a CRC error
- Receive byte counter
  - Registers 4.F024, 4.F025, and 4.F026
  - Counts the number of bytes in the frame including the CRC (note that preamble bytes are not counted)

## 5.7 PRBS and Pattern Generators

The device supports various IEEE defined and proprietary PRBS generators and checkers, and transmit waveform pattern generators. Only 1 generator/checker per lane may be enabled simultaneously.

### Caution

If multiple generators are enabled simultaneously, unpredictable results may occur.

### 5.7.1 General PRBS Generators and Checkers

Each lane has its own general PRBS generator and checker:

- Port 0 registers control lanes 0 and 4
- Port 1 registers control lanes 1 and 5
- Port 2 registers control lanes 2 and 6
- Port 3 registers control lanes 3 and 7

For lanes 0 to 3, the functionality is identical to [Section 4.7.1, General PRBS Generators and Checkers, on page 90](#) except the DEVAD is 4 instead of 3.

For lanes 4 to 7, the function of registers 4.F040 to 4.F049 is identical to registers 4.F030 to 4.F039 except the registers control a different lane.

### 5.7.2 10GBASE-R-Specific Generators and Checkers

The functionality is identical to [Section 4.7.2, 10GBASE-R Specific Generators and Checkers, on page 91](#) except the DEVAD is 4 instead of 3.

### 5.7.3 XAUI-Specific Generators and Checkers

Register 4.9010.2:0 can select any of the 5 jitter patterns specified by IEEE 802.3.

000 = Jitter 48A.1 (high freq)

001 = Jitter 48A.2 (low freq)

010 = Jitter 48A.3 (mix freq)

100 = Jitter 48A.4 (CRPAT)

101 = Jitter 48A.5 (CJPAT)

The transmit jitter pattern is enabled by setting 4.9010.4 to 1.

The 48A.1, 48A.2, and 48A.3 transmit patterns can also be enabled by setting register 3.1019.2 to 1 and selecting the pattern via register 3.1019.1:0.

There is a checker to check the CRPAT and CJPAT patterns. This is enabled by setting 4.9010.5 to 1.

Formation and incrementation of 32-bit counters is as follows:

- Register 4.9011 and 4.9012
  - Form 32-bit counter
  - Increment once for every CRPAT or CJPAT packet transmitted
- Register 4.9013 and 4.9014
  - Form 32-bit counter
  - Increment once for every CRPAT or CJPAT packet received
- Register 4.9015 and 4.9016
  - Form 32-bit counter
  - Increment once for every CRPAT or CJPAT packet received with error

The lower addressed register is the least significant 16 bits and the higher addressed register is the most significant 16 bits of the counter. When the least significant register is read, the upper register is updated and frozen so that the two register read is atomic. The counters can be cleared only by setting register 4.9010.7 to 1.

## 5.8 Interrupt

The Host PCS supports several interrupts. [Table 51](#) shows the interrupt enable, interrupt status, and real time status.

The INTn interrupt pin will be active if any of the events enabled in the interrupt enable register occurs. If an interrupt event corresponding to a disabled interrupt enable bit occurs, the corresponding interrupt status bit will be set even though the event does not activate the INTn pin. The interrupts are cleared after a read to the interrupt status register.

**Table 51: Interrupt Registers**

Type	Interrupt		Real-Time Status
	Enable	Status	
10GBASE-R	4.8000	4.8001	4.8002
XAUI RXAUI	4.9001, 3.9002	4.9003, 4.9004	4.9006
1000BASE-X	4.A001	4.A002	4.A003
Misc	4.F00A	4.F00B	

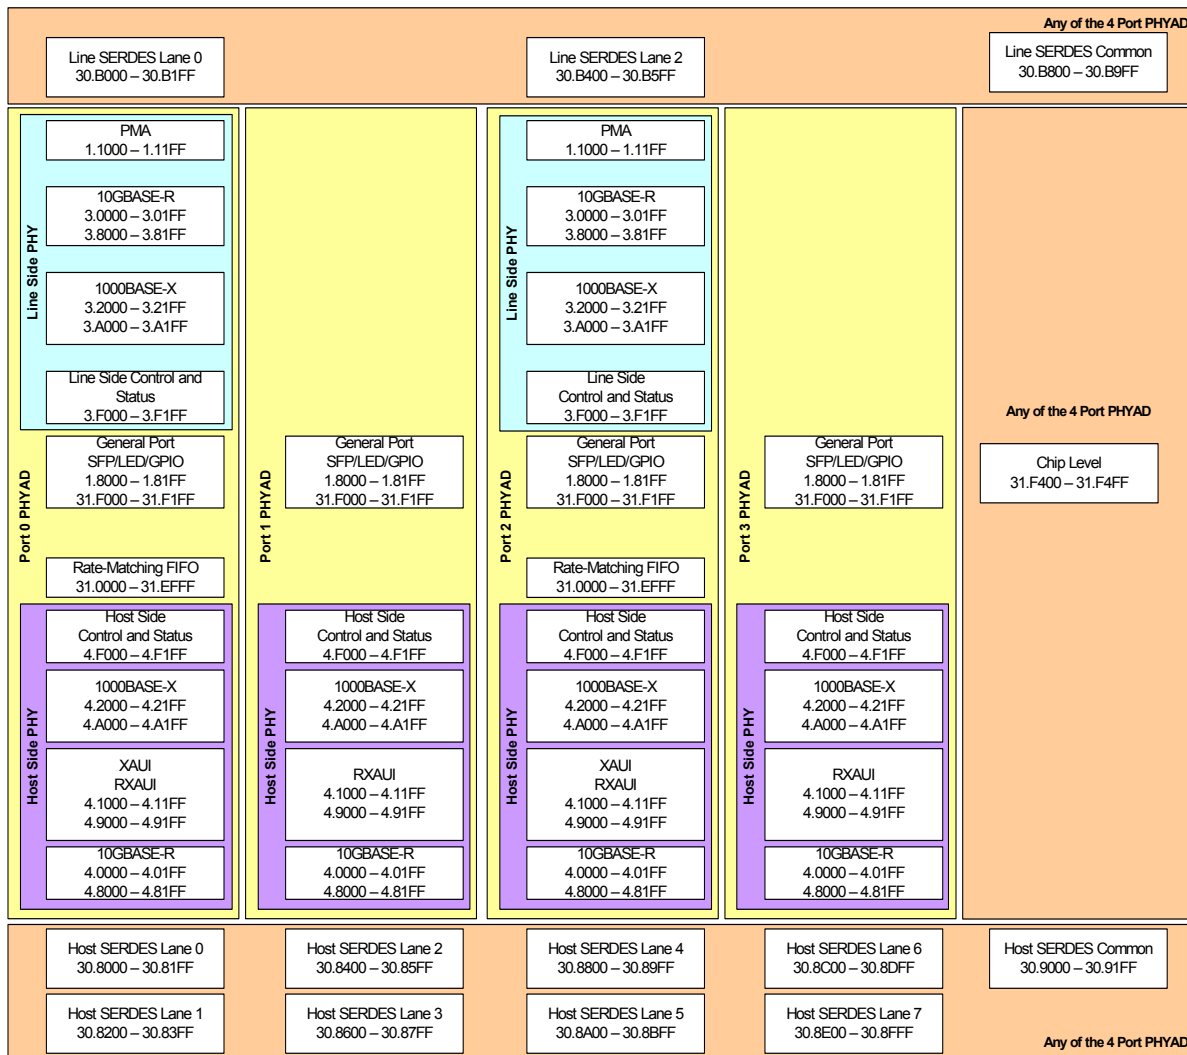

# 6 Register Description

This section includes information on the following topics:

- Section 6.1, Chip-level Registers
- Section 6.2, Port-level Registers
- Section 6.3, SFI Registers
- Section 6.4, XFI Registers

The registers are partitioned as shown in Figure 30.

Figure 30: 88X2222 Register Map Summary

## 6.1 Chip-level Registers

The registers in this section are accessible through any of the 4 PHY addresses.

**Table 52: Chip Level Registers — Register Map**

Register Name	Register Address	Table and Page

Device 31, Register 0xF420

Bits	Field	Mode	HW Rst	SW Rst	Description
15:8	Reserved	RO	0x00	Retain	0
7	M3 Interrupt Status	RO	0x0	Retain	0 = No Interrupt 1 = Active Interrupt
6	M2 Interrupt Status	RO	0x0	Retain	0 = No Interrupt 1 = Active Interrupt
5	M1 Interrupt Status	RO	0x0	Retain	0 = No Interrupt 1 = Active Interrupt
4	M0 Interrupt Status	RO	0x0	Retain	0 = No Interrupt 1 = Active Interrupt
3	N3 Interrupt Status	RO	0x0	Retain	0 = No Interrupt 1 = Active Interrupt
2	N2 Interrupt Status	RO	0x0	Retain	0 = No Interrupt 1 = Active Interrupt
1	N1 Interrupt Status	RO	0x0	Retain	0 = No Interrupt 1 = Active Interrupt
0	N0 Interrupt Status	RO	0x0	Retain	0 = No Interrupt 1 = Active Interrupt

**Table 61: Global Interrupt Control**  
**Device 31, Register 0xF421**

Bits	Field	Mode	HW Rst	SW Rst	Description
15	Speed_up_ti_timers	R/W	0x0	Retain	When set, accelerates cunit timer
14:3	Reserved	RO	0x000	Retain	Set to 0s.
2:1	Interrupt Polarity	R/W	0x2	Retain	00 = Active - drive INT low, Inactive - drive INT high 01 = Active - drive INT high, Inactive - drive INT low 10 = Active - drive INT low, Inactive - tristate INT 11 = Active - drive INT high, Inactive - tristate INT
0	Force Interrupt Pin Active	R/W	0x0	Retain	0 = Normal operation 1 = Force interrupt pin active

## 6.2 Port-level Registers

The registers in this section apply to all ports.

**Table 62: Port-level Registers — Register Map**

Register Name	Register Address	Table and Page
<a href="#">Two Wire Interface Caching Control/Status Register</a>	Device 1, Register 0x8000	<a href="#">Table 63, p. 108</a>
<a href="#">Two Wire Interface Memory Address Register</a>	Device 1, Register 0x8001	<a href="#">Table 64, p. 109</a>

**Table 63: Two Wire Interface Caching Control/Status Register**  
Device 1, Register 0x8000

Bits	Field	Mode	HW Rst	SW Rst	Description
15	Cache Valid Secondary Page	RO	0x0	0x0	0 = Registers 1.8087 to 1.8106 invalid 1 = Registers 1.8087 to 1.8106 valid This bit is set to 1 if at least one successful cache update is completed since hardware, software reset, or MOD0 transitions from 0 to 1. Use register 1.8000.14:13 for latest status.
14:13	Command Status Secondary Page	RO, SC	0x0	0x0	00 = Cache not updated since last read 01 = Contents in cache updated at least once since last read 10 = Cache is currently loading since last read 11 = All caching attempts since last read failed This register clears on read. Register 1.8000.15 indicates whether the content of the cache is valid from any updates in the past.
12:11	Cache Setting Secondary Page	R/W, SC	0x0	Retain	00 = No automatic caching 01 = Cache once at module plugin 10 = Cache at module plugin and periodically poll 11 = Manual cache refresh The page cached is selected by register 1.8004.7:0 This register will self clear when set to 11.
10	TWSI Reset	R/W, SC	0x0	0x0	0 = Normal operation 1 = Force TWSI circuit to reset
9	Cache Valid Page A0	RO	0x0	0x0	0 = Registers 1.8007 to 1.8086 invalid 1 = Registers 1.8007 to 1.8086 valid This bit is set to 1 if at least one successful cache update is completed since hardware, software reset, or MOD0 transitions from 0 to 1. Use register 1.8000.14:13 for latest status.
8:6	Reserved	RO	0x0	0x0	000
5	EEPROM Read/Write	RO	0x0	0x0	0 = Read. Writing from internal memory to EEPROM is not supported. Use registers 1.8001 and 1.8002 to write registers one by one if needed.
4	Reserved	RO	0x0	0x0	0
3:2	Command Status Page A0	RO, SC	0x0	0x0	00 = Cache not updated since last read 01 = Contents in cache updated at least once since last read 10 = Cache is currently loading since last read 11 = All caching attempts since last read failed This register clears on read. Register 1.8000.9 indicates whether the content of the cache is valid from any updates in the past.

**Table 63: Two Wire Interface Caching Control/Status Register (Continued)**  
**Device 1, Register 0x8000**

Bits	Field	Mode	HW Rst	SW Rst	Description
1:0	Cache Setting Page A0	R/W, SC	0x1	Retain	00 = No automatic caching 01 = Cache once at module plugin 10 = Cache at module plugin and periodically poll 11 = Manual cache refresh Page A0 lower 128 bytes are cached. This register will self clear when set to 11.

**Table 64: Two Wire Interface Memory Address Register**  
**Device 1, Register 0x8001**

Bits	Field	Mode	HW Rst	SW Rst	Description
15:9	Slave Address	R/W	0x50	Retain	Slave Address
8	Read/Write	R/W	0x1	Retain	A write to 1.8001 will initiate a read or write command on the two-wire interface if the two-wire interface is free, otherwise the read or write command will be ignored. Make sure register 1.8002.10:8 is not equal to 010 (command in progress) prior to writing register 1.8001. A read to 1.8001 will not trigger any action. Register 1.8003.7:0 must be set to the value to be written prior to issuing a write command. 1 = Read, 0 = Write
7:0	Byte Address	R/W	0x00	Retain	Byte Address

**Table 65: Two Wire Interface Memory Read Data and Status Register**  
**Device 1, Register 0x8002**

Bits	Field	Mode	HW Rst	SW Rst	Description
15:13	Reserved	RO	0x0	0x0	0000
12	Cache ECC Single Bit Corrected Interrupt Status	RO, LH	0x0	0x0	0 = No single bit correction in ECC cache detected 1 = Single bit correction in ECC cache detected
11	Cache ECC Uncorrectable Bit Interrupt Status	RO, LH	0x0	0x0	0 = No uncorrectable bit in ECC cache detected 1 = Uncorrectable bit in ECC cache detected

**Table 65: Two Wire Interface Memory Read Data and Status Register (Continued)**  
Device 1, Register 0x8002

Bits	Field	Mode	HW Rst	SW Rst	Description
10:8	TWSI Status	RO, LH	0x0	0x0	<p>Register 1.8002.10:8 is the status in response to setting to writing register 1.8001.</p> <p>Register 1.8002.10:8 will remain at 010 until the command is completed. Once the command is completed the status 001, 011, 100, 101, or 111 will remain until register 1.8002 is read. The register will clear on read.</p> <p>If a new command is issued by writing register 1.8001 without reading register 1.8002 for a previous command, the status of the previous command will be lost.</p> <p>If a command initiated by writing register 1.8001 is still in progress and a second command is issued, the status register 1.8002.10:8 will reflect the first command. The second command is ignored but register 1.8002.10:8 will not be set to 111.</p> <p>Command Done - No Error is set when the TWSI slave properly responds with ACK.</p> <p>In the case of a write command with automatic read back a Command Done - No Error status will be returned even if the read back data does not match the written data or if the TWSI slave does not respond with ACK during the read back.</p> <p>Register 1.8002.7:0 is valid only when register 1.8002.10:8 is set to 001.</p> <p>000 = Ready  001 = Command Done - No Error  010 = Command in Progress  011 = Write done but readback failed  100 = Reserved  101 = Command Failed  110 = Reserved  111 = two-wire interface Busy, Command Ignored</p>
7:0	Read Data	RO	0x00	0x00	<p>Read Data</p> <p>Register 1.8002.7:0 is valid only when register 1.8002.10:8 is set to 001.</p>

**Table 66: Two Wire Interface Memory Write Data and Control Register**  
Device 1, Register 0x8003

Bits	Field	Mode	HW Rst	SW Rst	Description
15:12	Write Time	R/W	0xA	Retain	<p>0000 = EEPROM takes 0ms to write  0001 = 1.05ms  ....  1110 = 14.68ms  1111 = 15.73ms</p>
11:10	Reserved	R/W	0x0	0x0	Set to 0
9	Automatic Read Back After Write	R/W	0x0	Retain	If read back is enabled then data will always be read back after a write. The read data is stored in register 1.8002.7:0 1 = Read back, 0 = no read back
8	Reserved	R/W	0x0	0x0	Set to 0

**Table 66: Two Wire Interface Memory Write Data and Control Register (Continued)**

**Table 75: GPIO Data**  
**Device 31, Register 0xF012**

Bits	Field	Mode	HW Rst	SW Rst	Description
15:12	Reserved	RO	0x0	Retain	Set to 0s.
11	SCL Data	R/W	0x0	Retain	This bit has no effect unless register 31.F016.15 = 1. When 31.F013.11 = 0 a read to this register will reflect the state of the SCL pin, and a write will write the output register but have no effect on the SCL pin. When 31.F013.11 = 1 a read to this register will reflect the state of the output register, and a write will write the output register and drive the state of the SCL pin.

**Table 75: GPIO Data (Continued)**  
Device 31, Register 0xF012

Bits	Field	Mode	HW Rst	SW Rst	Description
10	SDA Data	R/W	0x0	Retain	This bit has no effect unless register 31.F016.11 = 1. When 31.F013.10 = 0 a read to this register will reflect the state of the SDA pin, and a write will write the output register but have no effect on the SDA pin. When 31.F013.10 = 1 a read to this register will reflect the state of the output register, and a write will write the output register and drive the state of the SDA pin.
9	Reserved	RO	0x0	Retain	
8	TX_DISABLED Data	R/W	0x1	Retain	This bit has no effect unless register 31.F016.3 = 1. When 31.F013.8 = 0 a read to this register will reflect the state of the TX_DISABLED pin, and a write will write the output register but have no effect on the TX_DISABLED pin. When 31.F013.8 = 1 a read to this register will reflect the state of the output register, and a write will write the output register and drive the state of the TX_DISABLED pin.
7	DSP_LOCK Data	R/W	0x0	Retain	This bit has no effect unless register 31.F015.15 = 1. When 31.F013.7 = 0 a read to this register will reflect the state of the DSP_LOCK pin, and a write will write the output register but have no effect on the DSP_LOCK pin. When 31.F013.7 = 1 a read to this register will reflect the state of the output register, and a write will write the output register and drive the state of the DSP_LOCK pin.
6	MPC Data	R/W	0x0	Retain	This bit has no effect unless register 31.F015.11 = 1. When 31.F013.6 = 0 a read to this register will reflect the state of the MPC pin, and a write will write the output register but have no effect on the MPC pin. When 31.F013.6 = 1 a read to this register will reflect the state of the output register, and a write will write the output register and drive the state of the MPC pin.
5	LED1 Data	R/W	0x0	Retain	This bit has no effect unless register 31.F015.7 = 1. When 31.F013.5 = 0 a read to this register will reflect the state of the LED1 pin, and a write will write the output register but have no effect on the LED1 pin. When 31.F013.5 = 1 a read to this register will reflect the state of the output register, and a write will write the output register and drive the state of the LED1 pin.
4	LED0 Data	R/W	0x0	Retain	This bit has no effect unless register 31.F015.3 = 1. When 31.F013.4 = 0 a read to this register will reflect the state of the LED0 pin, and a write will write the output register but have no effect on the LED0 pin. When 31.F013.4 = 1 a read to this register will reflect the state of the output register, and a write will write the output register and drive the state of the LED0 pin.

**Table 75: GPIO Data (Continued)**  
**Device 31, Register 0xF012**

Bits	Field	Mode	HW Rst	SW Rst	Description
3	GPIO Data	R/W	0x0	Retain	When 31.F013.3 = 0 a read to this register will reflect the state of the GPIO pin, and a write will write the output register but have no effect on the GPIO pin. When 31.F013.3 = 1 a read to this register will reflect the state of the output register, and a write will write the output register and drive the state of the GPIO pin.
2	RX_LOS Data	R/W	0x0	Retain	When 31.F013.2 = 0 a read to this register will reflect the state of the RX_LOS pin, and a write will write the output register but have no effect on the RX_LOS pin. When 31.F013.2 = 1 a read to this register will reflect the state of the output register, and a write will write the output register and drive the state of the RX_LOS pin.
1	TX_FAULT Data	R/W	0x0	Retain	When 31.F013.1 = 0 a read to this register will reflect the state of the TX_FAULT pin, and a write will write the output register but have no effect on the TX_FAULT pin. When 31.F013.1 = 1 a read to this register will reflect the state of the output register, and a write will write the output register and drive the state of the TX_FAULT pin.
0	MOD_ABS Data	R/W	0x0	Retain	When 31.F013.0 = 0 a read to this register will reflect the state of the MOD_ABS pin, and a write will write the output register but have no effect on the MOD_ABS pin. When 31.F013.0 = 1 a read to this register will reflect the state of the output register, and a write will write the output register and drive the state of the MOD_ABS pin.

Device 1, Register 0x0000

Bits	Field	Mode	HW Rst	SW Rst	Description
15	Software Reset	R/W, SC	0x0	0x0	1 = Reset 0 = Normal This register will soft reset all PCS/PMA and associated registers of this interface.
14	Reserved	RO	0x0	0x0	Set to 0
13	Speed Select	RO	0x1	0x1	This bit is ignored and is always set to 1
12	Reserved	RO	0x0	0x0	Set to 0

**Table 90: PMA/PMD Control 1 (Continued)**  
Device 1, Register 0x0000

Bits	Field	Mode	HW Rst	SW Rst	Description
11	Low Power	R/W	See Desc.	Retain	1 = Power Down 0 = Normal This register will power down all PCS/PMA of this interface. Initial power state is a function of hardware configuration.
10:7	Reserved	RO	0x0	0x0	Set to 0s
6	Speed Select	RO	0x1	0x1	This bit is ignored and is always set to 1
5:2	Speed Select	RO	0x0	0x0	This register is ignored. Speed is automatically set based on the mode selected in register 31.F002
1	PMA Remote Loopback	R/W	0x0	0x0	0 = Disable PMA remote loopback. Writing this register has no effect.
0	PMA Local Loopback	R/W	0x0	0x0	0 = Disable PMA local loopback. 1 = PMA shall loopback transmit data on the received path.

**Table 91: PMA/PMD Status 1**  
Device 1, Register 0x0001

Bits	Field	Mode	HW Rst	SW Rst	Description
15:8	Reserved	RO	0x00	0x00	00000000
7	Fault	RO	0x0	0x0	1 = Fault condition 0 = No fault condition Bit 1.0001.7 = 1.0008.11 OR 1.0008.10
6:3	Reserved	RO	0x0	0x0	0000
2	Receive Link Status	RO, LL	0x0	0x0	1 = PMA/PMD link up 0 = PMA/PMD link down Bit 1.0001.2 is the inverse of 1.0008.10
1	Low Power Ability	RO	0x1	0x1	1 = PMA/PMD supports low power
0	Reserved	RO	0x0	0x0	0

**Table 115: 10GBASE-R PCS Control 1**  
Device 3, Register 0x0000

Bits	Field	Mode	HW Rst	SW Rst	Description
15	Software Reset	R/W, SC	0x0	0x0	1 = Reset 0 = Normal This register will soft reset all PCS/PMA and associated registers of this interface.
14	Loopback	R/W	0x0	0x0	1 = Loopback 0 = Normal
13	Speed Select	RO	0x1	0x1	1 = Bits 5:2 select speed.

**Table 115: 10GBASE-R PCS Control 1 (Continued)**  
Device 3, Register 0x0000

Bits	Field	Mode	HW Rst	SW Rst	Description
12	Reserved	RO	0x0	0x0	0
11	Low Power	R/W	See Desc.	Retain	1 = Power Down 0 = Normal This register will power down all PCS/PMA of this interface. Initial power state is a function of hardware configuration.
10	Clock Stoppable	R/W	0x0	0x0	1 = Clock stoppable during LPI 0 = Clock not stoppable
9:7	Reserved	RO	0x0	0x0	000
6	Speed Select	RO	0x1	0x1	1 = Bits 5:2 select speed.
5:2	Speed Select	RO	0x0	0x0	This register is ignored. Speed is automatically set based on the mode selected in register 31.F002
1:0	Reserved	RO	0x0	0x0	00

**Table 116: 10GBASE-R PCS Status 1**  
Device 3, Register 0x0001

Bits	Field	Mode	HW Rst	SW Rst	Description
15:12	Reserved	RO	0x0	0x0	00000000
11	TX LP Idle Received	RO/LH	0x0	0x0	1 = Tx PCS has received LP Idle 0 = LP Idle not received
10	Rx LP Idle Received	RO/LH	0x0	0x0	1 = Rx PCS has received LP Idle 0 = LP Idle not received
9	Tx LP Idle Indication	RO	0x0	0x0	1 = Tx PCS is currently receiving LP Idle 0 = Tx PCS is not currently receiving LP Idle
8	Rx LP Idle Indication	RO	0x0	0x0	1 = Rx PCS is currently receiving LP Idle 0 = Rx PCS is not currently receiving LP Idle
7	Fault	RO	0x0	0x0	1 = Fault condition 0 = No fault condition
6	Clock Stop Capable	RO	0x0	0x0	0 = Clock not stoppable
5:3	Reserved	RO	0x0	0x0	000
2	Link Status	RO, LL	0x0	0x0	1 = PCS link up 0 = PCS link down
1	Low Power Ability	RO	0x1	0x1	1 = PCS Supports Low Power
0	Reserved	RO	0x0	0x0	0

**Table 143: 1000BASE-X/SGMII Control Register**  
Device 3, Register 0x2000

Bits	Field	Mode	HW Rst	SW Rst	Description
15	Reset	R/W, SC	0x0	0x0	1 = Reset 0 = Normal This register will soft reset all PCS/PMA and associated registers of this interface.
14	Loopback	R/W	See Desc.	Retain	1 = Loopback 0 = Normal
13	SGMII Speed (LSB)	R/W	See Desc.	Retain	This register is used to control SGMII speed only. (bit 6, bit 13) 00 = 10Mb/s, 01 = 100Mb/s, 10 = 1000Mb/s
12	1000BASE-X Auto-Negotiation Enable	R/W	See Desc.	Retain	If the value of this bit is Changed, the link will be broken and 1000BASE-X Auto-Negotiation restarted (bit 3.2000.9 is set to 1). 1 = Enable Auto-Negotiation Process 0 = Disable Auto-Negotiation Process

**Table 143: 1000BASE-X/SGMII Control Register (Continued)**  
Device 3, Register 0x2000

Bits	Field	Mode	HW Rst	SW Rst	Description
11	Power Down	R/W	See Desc.	Retain	1 = Power Down 0 = Normal This register will power down all PCS/PMA of this interface. Initial power state is a function of hardware configuration.
10	Isolate	RO	0x0	0x0	The core bus is embedded hence this function is not supported
9	Restart 1000BASE-X Negotiation	R/W, SC	0x1	SC	Auto-Negotiation automatically restarts after hardware reset, software reset (3.2000.15) or Change in auto-negotiation enable (3.2000.12) regardless of whether or not the restart bit (3.2000.9) is set. The bit is set when Auto-negotiation is Enabled or Disabled in 3.2000.12. 1 = Restart Auto-Negotiation Process 0 = Normal operation
8	Duplex Mode	RO	0x1	Retain	Writing this bit has no effect since only full duplex mode is supported. 1 = Full-duplex 0 = Half-Duplex
7	Collision Test	R/W	0x0	0x0	No effect since half-duplex not supported. 1 = Enable COL signal test 0 = Disable COL signal test
6	SGMII Speed Selection (MSB)	R/W	See Desc.	Retain	This register is used to control SGMII speed only. (bit 6, bit 13) 00 = 10Mb/s, 01 = 100Mb/s, 10 = 1000Mb/s
5:0	Reserved	RO	0x00	0x00	Always 0.

**Table 144: 1000BASE-X/SGMII Status Register**  
Device 3, Register 0x2001

Bits	Field	Mode	HW Rst	SW Rst	Description
15	100BASE-T4	RO	0x0	0x0	0 = PHY not able to perform 100BASE-T4
14	100BASE-X Full-Duplex	RO	0x0	0x0	0 = PHY not able to perform full duplex 100BASE-X
13	100BASE-X Half-Duplex	RO	0x0	0x0	0 = PHY not able to perform half-duplex 100BASE-X
12	10 Mb/S Full Duplex	RO	0x0	0x0	0 = PHY not able to perform full-duplex 10BASE-T
11	10 Mbps Half-Duplex	RO	0x0	0x0	0 = PHY not able to perform half-duplex 10BASE-T
10	100BASE-T2 Full-Duplex	RO	0x0	0x0	0 = PHY not able to perform full-duplex
9	100BASE-T2 Half-Duplex	RO	0x0	0x0	0 = PHY not able to perform half-duplex

**Table 144: 1000BASE-X/SGMII Status Register (Continued)**  
Device 3, Register 0x2001

Bits	Field	Mode	HW Rst	SW Rst	Description
8	Extended Status	RO	0x1	0x1	1 = Extended status information in Register 3.200F
7	Reserved	RO	0x0	0x0	Must always be 0.
6	MF Preamble Suppression	RO	0x1	0x1	1 = PHY accepts management frames with preamble suppressed
5	1000BASE-X Auto-Negotiation Complete	RO	0x0	0x0	1 = Auto-Negotiation process complete 0 = Auto-Negotiation process not complete Bit is not set when link is up due of Fiber Auto-negotiation Bypass or if Auto-negotiation is disabled.
4	1000BASE-X Remote Fault	RO,LH	0x0	0x0	1 = Remote fault condition detected 0 = Remote fault condition not detected This bit is always 0 in SGMII modes.
3	Auto-Negotiation Ability	RO	See Desc.	See Desc.	If register 3.F002.6= 1, then this bit is always 1, otherwise this bit is 0. 1 = PHY able to perform Auto-Negotiation 0 = PHY not able to perform Auto-Negotiation
2	1000BASE-X Link Status	RO,LL	0x0	0x0	This register bit indicates when link was lost since the last read. For the current link status, read this register back-to-back. 1 = Link is up 0 = Link is down
1	Reserved	RO,LH	Always 0	Always 0	Must be 0
0	Extended Capability	RO	Always 1	Always 1	1 = Extended register capabilities

13:0	Reserved	RO	0x0000	0x0000	Received Code Word Bits 13:0 Must receive 00_0000_0000_0001 per SGMII spec

**Table 152: SGMII (System side) Link Partner Ability Register**  
Device 3, Register 0x2005

Bits	Field	Mode	HW Rst	SW Rst	Description
15	Link	RO	0x0	0x0	Register bit is cleared when link goes down and loaded when a base page is received Received Code Word Bit 15 1 = Copper Link is up on the link partner 0 = Copper Link is not up on the link partner
14	Acknowledge	RO	0x0	0x0	Register bit is cleared when link goes down and loaded when a base page is received Acknowledge Received Code Word Bit 14 1 = Link partner received link code word 0 = Link partner has not received link code word
13	Reserved	RO	0x0	0x0	Register bit is cleared when link goes down and loaded when a base page is received Received Code Word Bit 13 Must be 0
12	Duplex Status	RO	0x0	0x0	Register bit is cleared when link goes down and loaded when a base page is received Received Code Word Bit 12 1 = Copper Interface on the Link Partner is capable of Full Duplex 0 = Copper Interface on the link partner is capable of Half Duplex
11:10	Speed Status	RO	0x0	0x0	Register bits are cleared when link goes down and loaded when a base page is received Received Code Word Bit 11:10 00 = 10 Mbps 01 = 100 Mbps 10 = 1000 Mbps 11 = reserved
9	Transmit Pause Status	RO	0x0	0x0	This bit is non-zero only if the link partner supports enhanced SGMII Auto-Negotiation. Received Code Word Bit 9 0 = Disabled, 1 = Enabled

**Table 152: SGMII (System side) Link Partner Ability Register (Continued)**  
Device 3, Register 0x2005

Bits	Field	Mode	HW Rst	SW Rst	Description
8	Receive Pause Status	RO	0x0	0x0	This bit is non-zero only if the link partner supports enhanced SGMII Auto-Negotiation. Received Code Word Bit 8 0 = Disabled, 1 = Enabled
7	Fiber/Copper Status	RO	0x0	0x0	This bit is non-zero only if the link partner supports enhanced SGMII Auto-Negotiation. Received Code Word Bit 7 0 = Copper media, 1 = Fiber media
6:0	Reserved	RO	0x00	0x00	Register bits are cleared when link goes down and loaded when a base page is received Received Code Word Bits 6:0 Must be 0000001

**Table 153: 1000BASE-X Auto-Negotiation Expansion Register**  
Device 3, Register 0x2006

Bits	Field	Mode	HW Rst	SW Rst	Description
15:4	Reserved	RO	0x000	0x000	Reserved. Must be 000000000000.
3	Link Partner Next Page Able	RO	0x0	0x0	In SGMII mode this bit is always 0. In 1000BASE-X mode register 3.2006.3 is set when a base page is received and the received link control word has bit 15 set to 1. The bit is cleared when link goes down. 1 = Link Partner is Next Page able 0 = Link Partner is not Next Page able
2	Local Next Page Able	RO	0x1	0x1	1 = Local Device is Next Page able
1	Page Received	RO, LH	0x0	0x0	Register 3.2006.1 is set when a valid page is received. 1 = A New Page has been received 0 = A New Page has not been received
0	Link Partner Auto-Negotiation Able	RO	0x0	0x0	This bit is set when there is sync status, the fiber receiver has received 3 non-zero matching valid configuration code groups and Auto-negotiation is enabled in register 3.2000.12 1 = Link Partner is Auto-Negotiation able 0 = Link Partner is not Auto-Negotiation able

**Table 154: 1000BASE-X Next Page Transmit Register**  
Device 3, Register 0x2007

Bits	Field	Mode	HW Rst	SW Rst	Description
15	Next Page	R/W	0x0	0x0	A write to register 7 implicitly sets a variable in the Auto-Negotiation state machine indicating that the next page has been loaded. Register 7 only has effect in the 1000BASE-X mode. Transmit Code Word Bit 15

**Table 154: 1000BASE-X Next Page Transmit Register (Continued)**  
**Device 3, Register 0x2007**

Bits	Field	Mode	HW Rst	SW Rst	Description
14	Reserved	RO	0x0	0x0	Transmit Code Word Bit 14
13	Message Page Mode	R/W	0x1	0x1	Transmit Code Word Bit 13
12	Acknowledge2	R/W	0x0	0x0	Transmit Code Word Bit 12
11	Toggle	RO	0x0	0x0	Transmit Code Word Bit 11. This bit is internally set to the opposite value each time a page is received
10:0	Message/ Unformatted Field	R/W	0x001	0x001	Transmit Code Word Bit 10:0

**Table 155: 1000BASE-X Link Partner Next Page Register**  
**Device 3, Register 0x2008**

Bits	Field	Mode	HW Rst	SW Rst	Description
15	Next Page	RO	0x0	0x0	Register 8 only has effect in the 1000BASE-X mode. The register is loaded only when a next page is received from the link partner. It is cleared each time the link goes down. Received Code Word Bit 15
14	Acknowledge	RO	0x0	0x0	Received Code Word Bit 14
13	Message Page	RO	0x0	0x0	Received Code Word Bit 13
12	Acknowledge2	RO	0x0	0x0	Received Code Word Bit 12
11	Toggle	RO	0x0	0x0	Received Code Word Bit 11
10:0	Message/ Unformatted Field	RO	0x000	0x000	Received Code Word Bit 10:0

**Table 156: Extended Status Register**  
**Device 3, Register 0x200F**

Bits	Field	Mode	HW Rst	SW Rst	Description
15	1000BASE-X Full-Duplex	RO	0x1	0x1	1 = 1000 BASE-X full duplex capable 0 = not 1000 BASE-X full duplex capable
14	1000BASE-X Half-Duplex	RO	0x0	0x0	1 = 1000 BASE-X half duplex capable 0 = not 1000 BASE-X half duplex capable
13	1000BASE-T Full-Duplex	RO	0x0	0x0	0 = not 1000 BASE-T full duplex capable
12	1000BASE-T Half-Duplex	RO	0x0	0x0	0 = not 1000 BASE-T half duplex capable
11:0	Reserved	RO	0x000	0x000	000000000000

**Table 157: 1000BASE-X Timer Mode Select Register**  
Device 3, Register 0xA000

Bits	Field	Mode	HW Rst	SW Rst	Description
15:14	SGMII Autoneg Timer Select	R/W	0x0	Retain	Selects link_timer value in SGMII mode 00 = 1.6ms 01 = 0.5us 10 = 1us 11 = 2us
13	Serial Interface Auto-Negotiation Bypass Enable	R/W	0x1	Retain	Changes to this bit are disruptive to the normal operation; hence, any Changes to these registers must be followed by software reset to take effect. 1 = Bypass Allowed 0 = No Bypass Allowed
12:2	Reserved	RO	0x000	0x000	
1	Reserved	R/W	0x0	Retain	Reserved
0	Noise Filter	R/W	0x0	Retain	When set, noise filter is enabled.

**Table 158: 1000BASE-X Interrupt Enable Register**  
Device 3, Register 0xA001

### 6.3.5 SFI SERDES Registers

By default LDSP tries to automatically train the link partner for the best transmitter settings. The transmitter comes up with default settings which can be read back from registers in [Table 201](#) to [Table 208](#). If manual forcing of transmitter amplitude/pre/post emphasis is desired, it can be achieved by writing to the same registers. Here register address 1E.B116.15 should be read as 0x1E.0xB116 and so on. The registers in this section apply to ports 0 and 2.

**Table 200: SFI SERDES Registers — Register Map**

Register Name	Register Address	Table and Page
<a href="#">SFI Transmitter Lane 0 Settings</a>	Register 0x1E.0xB116	<a href="#">Table 201, p. 173</a>

**Table 210: 10GBASE-R PCS Control 1**  
Device 4, Register 0x0000

Bits	Field	Mode	HW Rst	SW Rst	Description
15	Software Reset	R/W, SC	0x0	0x0	1 = Reset 0 = Normal This register will soft reset all PCS/PMA and associated registers of this interface.
14	Loopback	R/W	0x0	0x0	1 = Loopback 0 = Normal
13	Speed Select	RO	0x1	0x1	1 = Bits 5:2 select speed.
12	Reserved	RO	0x0	0x0	0
11	Low Power	R/W	See Desc.	Retain	1 = Power Down 0 = Normal This register will power down all PCS/PMA of this interface. Initial power state is a function of hardware configuration.

**Table 210: 10GBASE-R PCS Control 1 (Continued)**  
**Device 4, Register 0x0000**

Bits	Field	Mode	HW Rst	SW Rst	Description
10	Clock Stoppable	R/W	0x0	0x0	1 = Clock stoppable during LPI 0 = Clock not stoppable
9:7	Reserved	RO	0x0	0x0	000
6	Speed Select	RO	0x1	0x1	1 = Bits 5:2 select speed.
5:2	Speed Select	RO	0x0	0x0	This register is ignored. Speed is automatically set based on the mode selected in register 31.F002
1:0	Reserved	RO	0x0	0x0	00

**Table 211: 10GBASE-R PCS Status 1**

**Table 257: 1000BASE-X/SGMII Control Register**  
Device 4, Register 0x2000

Bits	Field	Mode	HW Rst	SW Rst	Description
15	Reset	R/W, SC	0x0	0x0	1 = Reset 0 = Normal This register will soft reset all PCS/PMA and associated registers of this interface.
14	Loopback	R/W	See Desc.	Retain	1 = Loopback 0 = Normal
13	SGMII Speed (LSB)	R/W	See Desc.	Retain	This register is used to control SGMII speed only. (bit 6, bit 13) 00 = 10Mb/s, 01 = 100Mb/s, 10 = 1000Mb/s
12	1000BASE-X Auto-Negotiation Enable	R/W	See Desc.	Retain	If the value of this bit is Changed, the link will be broken and 1000BASE-X Auto-Negotiation restarted (bit 4.2000.9 is set to 1). 1 = Enable Auto-Negotiation Process 0 = Disable Auto-Negotiation Process

**Table 257: 1000BASE-X/SGMII Control Register (Continued)**  
Device 4, Register 0x2000

Bits	Field	Mode	HW Rst	SW Rst	Description
11	Power Down	R/W	See Desc.	Retain	1 = Power Down 0 = Normal This register will power down all PCS/PMA of this interface. Initial power state is a function of hardware configuration.
10	Isolate	RO	0x0	0x0	The core bus is embedded hence this function is not supported
9	Restart 1000BASE-X Negotiation	R/W, SC	0x1	SC	Auto-Negotiation automatically restarts after hardware reset, software reset (4.2000.15) or Change in auto-negotiation enable (4.2000.12) regardless of whether or not the restart bit (4.2000.9) is set. The bit is set when Auto-negotiation is Enabled or Disabled in 4.2000.12. 1 = Restart Auto-Negotiation Process 0 = Normal operation
8	Duplex Mode	RO	0x1	Retain	Writing this bit has no effect since only full duplex mode is supported. 1 = Full-duplex 0 = Half-Duplex
7	Collision Test	R/W	0x0	0x0	No effect since half-duplex not supported. 1 = Enable COL signal test 0 = Disable COL signal test
6	SGMII Speed Selection (MSB)	R/W	See Desc.	Retain	This register is used to control SGMII speed only. (bit 6, bit 13) 00 = 10Mb/s, 01 = 100Mb/s, 10 = 1000Mb/s
5:0	Reserved	RO	0x00	0x00	Always 0.

**Table 258: 1000BASE-X/SGMII Status Register**  
Device 4, Register 0x2001

Bits	Field	Mode	HW Rst	SW Rst	Description
15	100BASE-T4	RO	0x0	0x0	0 = PHY not able to perform 100BASE-T4
14	100BASE-X Full-Duplex	RO	0x0	0x0	0 = PHY not able to perform full duplex 100BASE-X
13	100BASE-X Half-Duplex	RO	0x0	0x0	0 = PHY not able to perform half-duplex 100BASE-X
12	10 Mb/S Full Duplex	RO	0x0	0x0	0 = PHY not able to perform full-duplex 10BASE-T
11	10 Mbps Half-Duplex	RO	0x0	0x0	0 = PHY not able to perform half-duplex 10BASE-T
10	100BASE-T2 Full-Duplex	RO	0x0	0x0	0 = PHY not able to perform full-duplex
9	100BASE-T2 Half-Duplex	RO	0x0	0x0	0 = PHY not able to perform half-duplex
8	Extended Status	RO	0x1	0x1	1 = Extended status information in Register 4.200F

**Table 258: 1000BASE-X/SGMII Status Register (Continued)**  
Device 4, Register 0x2001

Bits	Field	Mode	HW Rst	SW Rst	Description
7	Reserved	RO	0x0	0x0	Must always be 0.
6	MF Preamble Suppression	RO	0x1	0x1	1 = PHY accepts management frames with preamble suppressed
5	1000BASE-X Auto-Negotiation Complete	RO	0x0	0x0	1 = Auto-Negotiation process complete 0 = Auto-Negotiation process not complete Bit is not set when link is up due of Fiber Auto-negotiation Bypass or if Auto-negotiation is disabled.
4	1000BASE-X Remote Fault	RO,LH	0x0	0x0	1 = Remote fault condition detected 0 = Remote fault condition not detected This bit is always 0 in SGMII modes.
3	Auto-Negotiation Ability	RO	See Desc.	See Desc.	If register 4.F002.6= 1, then this bit is always 1, otherwise this bit is 0. 1 = PHY able to perform Auto-Negotiation 0 = PHY not able to perform Auto-Negotiation
2	1000BASE-X Link Status	RO,LL	0x0	0x0	This register bit indicates when link was lost since the last read. For the current link status, read this register back-to-back. 1 = Link is up 0 = Link is down
1	Reserved	RO,LH	Always 0	Always 0	Must be 0
0	Extended Capability	RO	Always 1	Always 1	1 = Extended register capabilities

**Table 276: SERDES Control Register 1**  
Device 4, Register 0xF003

Bits	Field	Mode	HW Rst	SW Rst	Description
15:14	Reserved	RO	0x0	0x0	Set to 0s
13	Ftygr_1byte_ipg	R/W	0x0	Retain	1 = In Ftygkr mode PPM_FIFO will do ppm adjustments maintaining up to a min of one byte of IPG (Just the /T/). 0 = PPM_FIFO will do ppm adjustments maintaining up to a min of 5 bytes of IPG(/ T I I I I /)
12	Host Loopback	R/W	0x0	0x0	1 = Enable Loopback 0 = Normal Operation
11	Reserved	RO	0x0	0x0	0
10	Force Link Good	R/W	0x0	Retain	If link is forced to be good, the link state machine is bypassed and the link is always up. 1 = Force link good 0 = Normal operation
9	Reserved	RO	0x0	0x0	0
8	Receiver Power Down	R/W	0x0	Retain	1 = Receiver Powered Down 0 = Receiver Can Power Up
7	Force Signal Detect	R/W	0x0	Retain	1 = Force signal detect to be good 0 = Normal Operation
6	Block Transmit On Loopback	R/W	0x0	Retain	0 = Do not block ingress path 1 = Block ingress path
5:0	Reserved	R/W	0x00	Retain	Set to 0s.

**Table 277: Repeater mode Phase\_FIFO Status**  
**Device 4, Register 0xF008**

Bits	Field	Mode	HW Rst	SW Rst	Description
15:3	Reserved	RO	0x0000	0x0000	Set to 0
2	Repxg-X phase_FIFO error	RO,LH	0x0	0x0	This bit is latched HIGH whenever Repxg-X phase_FIFO empty or full flag is asserted. Cleared on read.
1	Repxg-R phase_FIFO full	RO,LH	0x0	0x0	This bit is latched HIGH whenever Repxg-R phase_FIFO full flag is asserted. Cleared on read.
0	Repxg-R phase_FIFO empty	RO,LH	0x0	0x0	This bit is latched HIGH whenever Repxg-R phase_FIFO empty flag is asserted. Cleared on read.

**Table 278: FIFO and CRC Interrupt Enable**  
**Device 4, Register 0xF00A**

Bits	Field	Mode	HW Rst	SW Rst	Description
15:3	Reserved	R/W	0x0000	Retain	Set to 0
2	CRC Interrupt Enable	R/W	0x0	Retain	1 = Interrupt enable 0 = Interrupt disable
1	FIFO Overflow Interrupt Enable	R/W	0x0	Retain	1 = Interrupt enable 0 = Interrupt disable
0	FIFO Underflow Interrupt Enable	R/W	0x0	Retain	1 = Interrupt enable 0 = Interrupt disable

**Table 279: FIFO and CRC Interrupt Status**  
**Device 4, Register 0xF00B**

Bits	Field	Mode	HW Rst	SW Rst	Description
15:3	Reserved	RO	0x0000	0x0000	0
2	CRC Interrupt Status	RO,LH	0x0	0x0	This interrupt will be set only if the packet checker is enabled. 1 = CRC Error detected 0 = CRC error not detected
1	FIFO Overflow Status	RO,LH	0x0	0x0	1 = FIFO overflow occurred 0 = FIFO overflow did not occur
0	FIFO Underflow Status	RO,LH	0x0	0x0	1 = FIFO underflow occurred 0 = FIFO underflow did not occur

**Table 280: PPM FIFO Control 1**  
Device 4, Register 0xF00C

Bits	Field	Mode	HW Rst	SW Rst	Description
15:14	PPM FIFO Depth	R/W	0x0	0x0	PPM FIFO depth selection Default setting varies based on the PCS mode. 10GBASE-R, XAUI, RXAUI: 01 else: 00
13:0	Reserved	RO	0x0000	0x0000	Set to 0s

**Table 281: Packet Generation Control 1**  
Device 4, Register 0xF010

Bits	Field	Mode	HW Rst	SW Rst	Description
15	Read Clear	R/W	0x0	Retain	1 = Enable clear on read 0 = Use 4.F010.6 to clear counters
14:7	Reserved	R/W	0x00	0x00	Set to 0s.
6	Pkt-Gen/Chk Counter Reset	R/W, SC	0x0	0x0	This bit self clears after counters are cleared. 1 = Clear counters, 0 = Normal Operation
5:3	Reserved	RO	0x0	0x0	0000
2	Use SFD in Checker	R/W	0x0	0x0	0 = Look for SFD before starting CRC checking 1 = Start CRC checking after the first 8 bytes in packet
1	Transmit Test Pattern Enable	R/W	0x0	0x0	1 = Pkt generator enable, 0 = Disable
0	Receive Test Pattern Enable	R/W	0x0	0x0	1 = Pkt checker enable, 0 = Disable

**Table 282: Packet Generation Control 2**  
Device 4, Register 0xF011

Bits	Field	Mode	HW Rst	SW Rst	Description
15:8	Reserved	RO	0x00	Retain	Set to 0s
7:4	Internal Packet Generation Control	R/W	0x0	Retain	000x = No Mask 0010 = Invert every other word 0011 = 2 no invert, 2 invert 0100 = left shift byte 0101 = Right shift byte 0110 = Left shift word 0111 = Right shift word 1000 = Increment byte 1001 = Decrement byte 1010 = Pseudo random byte 1011 = Pseudo random word 11xx = Reserved
3	CRC Generation	R/W	0x0	Retain	0 = On, 1 = Off
2:0	Reserved	RO	0x0	Retain	Set to 0s

**Table 283: Initial Payload 0-1/Packet Generation**  
Device 4, Register 0xF012

Bits	Field	Mode	HW Rst	SW Rst	Description
15:8	Byte 1	R/W	0x00	Retain	Initial payload value for byte 1
7:0	Byte 0	R/W	0x00	Retain	Initial payload value for byte 0

**Table 284: Initial Payload 2-3/Packet Generation**  
Device 4, Register 0xF013

Bits	Field	Mode	HW Rst	SW Rst	Description
15:8	Byte 3	R/W	0x00	Retain	Initial payload value for byte 1
7:0	Byte 2	R/W	0x00	Retain	Initial payload value for byte 0

**Table 285: Packet Generation Length**  
Device 4, Register 0xF016

Bits	Field	Mode	HW Rst	SW Rst	Description
15:0	Number Of Bytes In Frame	R/W	0x0000	Retain	0000 = Random length between 64 bytes to 1518 bytes 0001 = Random length between 64 bytes to 0x0FFF bytes 0002 = Random length between 64 bytes to 0x1FFF bytes 0003 = Random length between 64 bytes to 0x3FFF bytes 0004 = Random length between 64 bytes to 0x7FFF bytes 0005 = Random length between 64 bytes to 0xFFFF bytes 0006 to 0007 = Undefined 0008 to FFFF = Length in number of bytes

**Table 286: Packet Generation Burst Sequence**  
Device 4, Register 0xF017

Bits	Field	Mode	HW Rst	SW Rst	Description
15:0	Number Of Packets To Send	R/W	0x0000	Retain	0000 = Stop generation 0001 to FFFE = Number of packets to send FFFF = Continuous

**Table 287: Packet Generation IPG**  
Device 4, Register 0xF018

Bits	Field	Mode	HW Rst	SW Rst	Description
15	Random IPG	R/W	0x0	Retain	0 = Fixed IPG per bits 14:0 1 = Random IPG from 5 bytes to value specified per bits 14:0
14:0	IPG Duration	R/W	0x0002	Retain	Each bit equals 4 bytes of idle

**Table 288: Transmit Packet Counter [15:0]**  
Device 4, Register 0xF01B

Bits	Field	Mode	HW Rst	SW Rst	Description
15:0	Transmit Count [15:0]	RO	0x0000	0x0000	Counts the total number of packets transmitted. If 4.F010.14 = 0 then register does not clear on read. Cleared only when register 4.F010.6 transitions from 0 to 1. If 4.F010.14 = 1 then register clear on read.

**Table 289: Transmit Packet Counter [31:16]**  
Device 4, Register 0xF01C

Bits	Field	Mode	HW Rst	SW Rst	Description
15:0	Transmit Count [31:16]	RO	0x0000	0x0000	If 4.F010.14 = 0 then register does not clear on read. Cleared only when register 4.F010.6 transitions from 0 to 1. If 4.F010.14 = 1 then register clear on read. Must read register 4.F01B first in order to update this register. This ensures that the 48 bit read is atomic.

**Table 290: Transmit Packet Counter [47:32]**  
Device 4, Register 0xF01D

Bits	Field	Mode	HW Rst	SW Rst	Description
15:0	Transmit Count [47:32]	RO	0x0000	0x0000	If 4.F010.14 = 0 then register does not clear on read. Cleared only when register 4.F010.6 transitions from 0 to 1. If 4.F010.14 = 1 then register clear on read. Must read register 4.F01B first in order to update this register. This ensures that the 48 bit read is atomic.

**Table 291: Transmit Byte Counter [15:0]**  
Device 4, Register 0xF01E

Bits	Field	Mode	HW Rst	SW Rst	Description
15:0	Transmit Byte Count [15:0]	RO	0x0000	0x0000	Counts the total number of bytes in frame (including preamble) transmitted. If 4.F010.14 = 0 then register does not clear on read. Cleared only when register 4.F010.6 transitions from 0 to 1. If 4.F010.14 = 1 then register clear on read.

**Table 292: Transmit Byte Counter [31:16]**  
**Device 4, Register 0xF01F**

Bits	Field	Mode	HW Rst	SW Rst	Description
15:0	Transmit Byte Count [13:16]	RO	0x0000	0x0000	If 4.F010.14 = 0 then register does not clear on read. Cleared only when register 4.F010.6 transitions from 0 to 1. If 4.F010.14 = 1 then register clear on read. Must read register 4.F01E first in order to update this register. This ensures that the 48 bit read is atomic.

**Table 293: Transmit Byte Counter [47:32]**  
**Device 4, Register 0xF020**

Bits	Field	Mode	HW Rst	SW Rst	Description
15:0	Transmit Byte Count [47:32]	RO	0x0000	0x0000	If 4.F010.14 = 0 then register does not clear on read. Cleared only when register 4.F010.6 transitions from 0 to 1. If 4.F010.14 = 1 then register clear on read. Must read register 4.F01E first in order to update this register. This ensures that the 48 bit read is atomic.

**Table 294: Receive Packet Counter [15:0]**  
**Device 4, Register 0xF021**

Bits	Field	Mode	HW Rst	SW Rst	Description
15:0	Receive Count [15:0]	RO	0x0000	0x0000	Counts the total number of packets received. If 4.F010.14 = 0 then register does not clear on read. Cleared only when register 4.F010.6 transitions from 0 to 1. If 4.F010.14 = 1 then register clear on read.

**Table 295: Receive Packet Counter [31:16]**  
**Device 4, Register 0xF022**

Bits	Field	Mode	HW Rst	SW Rst	Description
15:0	Receive Count [31:16]	RO	0x0000	0x0000	If 4.F010.14 = 0 then register does not clear on read. Cleared only when register 4.F010.6 transitions from 0 to 1. If 4.F010.14 = 1 then register clear on read. Must read register 4.F021 first in order to update this register. This ensures that the 48 bit read is atomic.

**Table 296: Receive Packet Counter [47:32]**  
Device 4, Register 0xF023

Bits	Field	Mode	HW Rst	SW Rst	Description
15:0	Receive Count [47:32]	RO	0x0000	0x0000	If 4.F010.14 = 0 then register does not clear on read. Cleared only when register 4.F010.6 transitions from 0 to 1. If 4.F010.14 = 1 then register clear on read. Must read register 4.F021 first in order to update this register. This ensures that the 48 bit read is atomic.

**Table 297: Receive Byte Count [15:0]**  
Device 4, Register 0xF024

Bits	Field	Mode	HW Rst	SW Rst	Description
15:0	Byte Count [15:0]	RO	0x0000	0x0000	Counts the total number of bytes in frame (including preamble) received. If 4.F010.14 = 0 then register does not clear on read. Cleared only when register 4.F010.6 transitions from 0 to 1. If 4.F010.14 = 1 then register clear on read.

**Table 298: Receive Byte Count [31:16]**  
Device 4, Register 0xF025

Bits	Field	Mode	HW Rst	SW Rst	Description
15:0	Byte Count [31:16]	RO	0x0000	0x0000	If 4.F010.14 = 0 then register does not clear on read. Cleared only when register 4.F010.6 transitions from 0 to 1. If 4.F010.14 = 1 then register clear on read. Must read register 4.F024 first in order to update this register. This ensures that the 48 bit read is atomic.

**Table 299: Receive Byte Count [47:32]**  
Device 4, Register 0xF026

Bits	Field	Mode	HW Rst	SW Rst	Description
15:0	Byte Count [47:32]	RO	0x0000	0x0000	If 4.F010.14 = 0 then register does not clear on read. Cleared only when register 4.F010.6 transitions from 0 to 1. If 4.F010.14 = 1 then register clear on read. Must read register 4.F024 first in order to update this register. This ensures that the 48 bit read is atomic.

**Table 300: Receive Packet Error Count [15:0]**  
**Device 4, Register 0xF027**

Bits	Field	Mode	HW Rst	SW Rst	Description
15:0	Packet Error Count [15:0]	RO	0x0000	0x0000	Counts the number of packets with CRC Error received. If 4.F010.14 = 0 then register does not clear on read. Cleared only when register 4.F010.6 transitions from 0 to 1. If 4.F010.14 = 1 then register clear on read.

**Table 301: Receive Packet Error Count [31:16]**  
**Device 4, Register 0xF028**

Bits	Field	Mode	HW Rst	SW Rst	Description
15:0	Packet Error Count [31:16]	RO	0x0000	0x0000	If 4.F010.14 = 0 then register does not clear on read. Cleared only when register 4.F010.6 transitions from 0 to 1. If 4.F010.14 = 1 then register clear on read. Must read register 4.F027 first in order to update this register. This ensures that the 48 bit read is atomic.

**Table 302: Receive Packet Error Count [47:32]**  
**Device 4, Register 0xF029**

Bits	Field	Mode	HW Rst	SW Rst	Description
15:0	Packet Error Count [47:32]	RO	0x0000	0x0000	If 4.F010.14 = 0 then register does not clear on read. Cleared only when register 4.F010.6 transitions from 0 to 1. If 4.F010.14 = 1 then register clear on read. Must read register 4.F027 first in order to update this register. This ensures that the 48 bit read is atomic.

**Table 303: PRBS 0 Control**  
**Device 4, Register 0xF030**

Bits	Field	Mode	HW Rst	SW Rst	Description
15	Reserved	R/W	0x0	0x0	Set to 0s.
14	BER_mode_en	R/W	0x1	Retain	0 = Legacy mode of error count accumulation 1 = BER mode enabled for error accumulation. This is used for average Bit Error Rate (BER) calculation.
13	Read Clear	R/W	0x0	Retain	1 = Enable clear on read 0 = Use 4.F030.6 to clear counters
12:9	Reserved	R/W	0x0	0x0	Set to 0s.
8	PRBS Lock	RO	0x0	0x0	1 = PRBS locked, 0 = PRBS not locked
7	Immediate Error Count Enable	R/W	0x0	0x0	1 = Count PRBS errors before locking 0 = Wait until PRBS locks before counting
6	PRBS Counter Reset	R/W, SC	0x0	0x0	This bit self clears after counters are cleared. 1 = Clear counters, 0 = Normal Operation

Device 4, Register 0xF038

Bits	Field	Mode	HW Rst	SW Rst	Description
15:0	Lane 0 Error Count [31:16]	RO	0x0000	0x0000	If 4.F030.13 = 0 then register does not clear on read. Cleared only when register 4.F030.6 transitions from 0 to 1. If 4.F030.13 = 1 then register clear on read. Must read register 4.F037 first in order to update this register. This ensures that the 48 bit read is atomic.

**Table 312: PRBS 0 Error Count [47:32]**  
Device 4, Register 0xF039

Bits	Field	Mode	HW Rst	SW Rst	Description
15:0	Lane 0 Error Count [47:32]	RO	0x0000	0x0000	If 4.F030.13 = 0 then register does not clear on read. Cleared only when register 4.F030.6 transitions from 0 to 1. If 4.F030.13 = 1 then register clear on read. Must read register 4.F037 first in order to update this register. This ensures that the 48 bit read is atomic.

**Table 313: PRBS 0 Elapse Timer**  
Device 4, Register 0xF03A

Bits	Field	Mode	HW Rst	SW Rst	Description
15:0	Elapse Timer Count [15:0]	RO	0x0000	0x0000	Increments by 1 for every 2 second. Valid only if 4.F030.14 = 1 If 4.F030.13 = 0 then register does not clear on read, but cleared only when register 4.F030.6 transitions from 0 to 1. If 4.F030.13 = 1 then register clear on read. Must read register 4.F037 first in order to update this register.

**Table 314: PRBS 1 Control**  
Device 4, Register 0xF040

Bits	Field	Mode	HW Rst	SW Rst	Description
15	Reserved	R/W	0x0	0x0	Set to 0s.

**Table 314: PRBS 1 Control (Continued)**  
**Device 4, Register 0xF040**

Bits	Field	Mode	HW Rst	SW Rst	Description
14	BER_mode_en	R/W	0x1	0x1	0 = Legacy mode of error count accumulation 1 = BER mode enabled for error accumulation. This is used for average Bit Error Rate (BER) calculation.
13	Read Clear	R/W	0x0	Retain	1 = Enable clear on read 0 = Use 4.F040.6 to clear counters
12:9	Reserved	R/W	0x0	0x0	Set to 0s.
8	PRBS Lock	RO	0x0	0x0	1 = PRBS locked, 0 = PRBS not locked
7	Immediate Error Count Enable	R/W	0x0	0x0	1 = Count PRBS errors before locking 0 = Wait until PRBS locks before counting
6	PRBS Counter Reset	R/W, SC	0x0	0x0	This bit self clears after counters are cleared. 1 = Clear counters, 0 = Normal Operation
5	Transmit Test Pattern Enable	R/W	0x0	0x0	Test enabled only if the appropriate mode is selected. 1 = Enable, 0 = Disable
4	Receive Test Pattern Enable	R/W	0x0	0x0	Test enabled only if the appropriate mode is selected. Note that there is no receive checking done for IEEE 48.A.1, 48.A.2, and 48.A.3. 1 = Enable, 0 = Disable
3:0		R/W	0x0	0x0	0000 = IEEE 49.2.8 - PRBS 31 0001 = PRBS 7 0010 = PRBS 9 IEEE 83.7 0011 = PRBS 23 0100 = PRBS 31 Inverted 0101 = PRBS 7 Inverted 1000 = PRBS 15 1001 = PRBS 15 Inverted 0110 = PRBS 9 Inverted 0111 = PRBS 23 Inverted 1100 = High frequency pattern 1101 = Low frequency pattern 1110 = Mixed frequency pattern 1111 = Square Wave pattern

**Note**

This selection is valid in any SERDES speed.

**Table 315: PRBS 1 Symbol Tx Counter [15:0]**  
Device 4, Register 0xF041

Bits	Field	Mode	HW Rst	SW Rst	Description
15:0	Transmit Count [15:0]	RO	0x0000	0x0000	Increments by 1 for every bit transmitted per lane. If 4.F040.13 = 0 then register does not clear on read. Cleared only when register 4.F040.6 transitions from 0 to 1. If 4.F040.13 = 1 then register clear on read.

**Table 316: PRBS 1 Symbol Tx Counter [31:16]**

## 6.4.5 XFI SERDES Registers

The transmitter comes up with default settings which can be read back from registers in [Table 327](#) to [Table 334](#). If manual forcing of transmitter amplitude/pre/post emphasis is desired, it can be achieved by writing to the same registers. Here register address 1E.80E6 should be read as 0x1E.0x80E6 and so on.

**Table 326: XFI SERDES Registers — Register Map**

Register Name	Register Address	Table and Page
<a href="#">XFI Transmitter Lane 0 Settings</a>	Register 0x1E.0x80E6	<a href="#">Table 327, p. 223</a>

## Electrical Specifications

This section includes information on the following topics:

- [Section 7.1, Absolute Maximum Ratings](#)
- [Section 7.2, Recommended Operating Conditions](#)
- [Section 7.3, Package Thermal Information](#)
- [Section 7.4, Current Consumption](#)
- [Section 7.5, Digital I/O Electrical Specifications](#)
- [Section 7.6, XFI](#)
- [Section 7.7, SFI](#)
- [Section 7.8, Reference Clock](#)
- [Section 7.9, Latency](#)

### 7.1 Absolute Maximum Ratings<sup>1</sup>

**Table 335: Absolute Maximum Ratings<sup>1</sup>**

Stresses above those listed in Absolute Maximum Ratings may cause permanent device failure. Functionality at or above these limits is not implied. Exposure to absolute maximum ratings for extended periods may affect device reliability.

Symbol	Parameter	Min	Typ	Max	Units
V <sub>DDA15</sub>	Power Supply Voltage on AVDD15_N and AVDD15_M with respect to VSS	-0.5		1.8	V
V <sub>DDA11</sub>	Power Supply Voltage on AVDD11_N with respect to VSS	-0.5		1.5	V
V <sub>DDA10</sub>	Power Supply Voltage on AVDD10_M with respect to VSS	-0.5		1.5	V
V <sub>DD</sub>	Power Supply Voltage on DVDD with respect to VSS	-0.5		1.5	V
V <sub>DDO</sub>	Power Supply Voltage on VDDOT, VDDOS, VDDOL, and VDDOM with respect to VSS	-0.5		3.6	V
V <sub>PIN</sub>	Voltage applied to any digital input pin	-0.5		5.0 or V <sub>DDO</sub> + 0.7, whichever is less	V
T <sub>STORAGE</sub>	Storage temperature	-55		+125 <sup>2</sup>	°C

1. On power-up, no special power supply sequencing is required.

2. 125 °C is only used as bake temperature for not more than 24 hours. Long-term storage (for example, weeks or longer) should be kept at 85 °C or lower.

1. On power-up, no special power supply sequencing is required.

## 7.2 Recommended Operating Conditions

**Table 336: Recommended Operating Conditions**

Symbol	Parameter	Condition	Min	Typ	Max	Units
V <sub>DDA15</sub> <sup>1</sup>	AVDD15_M supply	For AVDD15_M	1.425	1.5	1.575	V
V <sub>DDA11</sub> <sup>1</sup>	AVDD11_N supply	For AVDD11_N	1.045	1.1	1.155	V
V <sub>DDA10</sub> <sup>1</sup>	AVDD10_M supply	For AVDD10_M	0.95	1.0	1.05	V
V <sub>DD</sub>	DVDD supply	For DVDD at 1.0V	0.95	1.0	1.05	V
V <sub>DDO</sub>	VDDOT, VDDOS, VDDOL, and VDDOM supply	For VDDO at 1.2V	1.14	1.2	1.26	V
		For VDDO at 1.5V	1.425	1.5	1.575	V
		For VDDO at 1.8V	1.71	1.8	1.89	V
		For VDDO at 2.5V	2.375	2.5	2.625	V
		For VDDO at 3.3V	3.13	3.3	3.47	V
RSET	Internal bias reference	Resistor connected to V <sub>SS</sub>		3650 ± 1% tolerance		Ω
T <sub>A</sub>	Commercial Ambient operating temperature		0		70 <sup>2</sup>	°C
T <sub>J</sub>	Maximum junction temperature				125 <sup>3</sup>	°C

1. Maximum noise allowed on supplies is 20 mV peak-peak.
2. Commercial operating temperatures are typically below 70 °C, e.g, 45 °C ~55 °C. The 70 °C max is Marvell specification limit
3. Refer to white paper on TJ Thermal Calculations for more information.

## 7.3 Package Thermal Information

### 7.3.1 Thermal Conditions for 324-pin, FCBGA Package

**Table 337: Thermal Conditions for 324-pin, FCBGA Package**

Symbol	Parameter	Condition	Min	Typ	Max	Units
$\theta_{JA}$	Thermal resistance <sup>1</sup> - junction to ambient for the 324-Pin, FCBGA package  $\theta_{JA} = (T_J - T_A) / P$ P = Total power dissipation	JEDEC 3 in. x 4.5 in. 4-layer PCB with no air flow		11.7		°C/W
		JEDEC 3 in. x 4.5 in. 4-layer PCB with 1 meter/sec air flow		10.0		°C/W
		JEDEC 3 in. x 4.5 in. 4-layer PCB with 2 meter/sec air flow		9.2		°C/W
		JEDEC 3 in. x 4.5 in. 4-layer PCB with 3 meter/sec air flow		8.7		°C/W
$\psi_{JT}$	Thermal characteristic parameter <sup>a</sup> - junction to top center of the 324-Pin, FCBGA package  $\psi_{JT} = (T_J - T_{top}) / P$ P = Total power dissipation, $T_{top}$ : Temperature on the top center of the package.	JEDEC 3 in. x 4.5 in. 4-layer PCB with no air flow		0.4		°C/W
		JEDEC 3 in. x 4.5 in. 4-layer PCB with 1 meter/sec air flow		0.4		°C/W
		JEDEC 3 in. x 4.5 in. 4-layer PCB with 2 meter/sec air flow		0.4		°C/W
		JEDEC 3 in. x 4.5 in. 4-layer PCB with 3 meter/sec air flow		0.4		°C/W
$\theta_{JC}$	Thermal resistance <sup>a</sup> - junction to case for the 324-Pin, FCBGA package  $\theta_{JC} = (T_J - T_C) / P_{top}$ $P_{top}$ = Power dissipation from the top of the package	JEDEC with no air flow		0.6		°C/W
$\theta_{JB}$	Thermal resistance <sup>a</sup> - junction to board for the 324-Pin, FCBGA package  $\theta_{JB} = (T_J - T_B) / P_{bottom}$ $P_{bottom}$ = Power dissipation from the bottom of the package to the PCB surface.	JEDEC with no air flow		3.1		°C/W

1. Refer to white paper on TJ Thermal Calculations for more information.

## 7.4 Current Consumption

### Warning

Current consumption numbers are estimates at this time and are subject to change.

The current consumption is broken down by each power supply. The total current consumption for each power supply is calculated by summing the various components in the tables below. The total chip power consumption is calculated as follows:

$$I_{\text{supply\_Total}} = I_{\text{supply\_Base}} + \sum_{N=0}^3 I_{\text{supply\_PCS}}(\text{port } N) + \sum_{N=0}^3 I_{\text{supply\_MS}}(\text{port } N)$$

$I_{\text{supply\_PCS}}$  = Current consumption for the PCS selected, 0 mA if the port is turned off.

$I_{\text{supply\_DSP}}$  = Incremental current consumption when the Electronic Dispersion Compensation DSP Engine is enabled, otherwise 0 mA.

Supply is one of AVDD15, AVDD11, AVDD10, and DVDD.

The current consumption numbers for  $I_{\text{supply\_PCS}}$  and  $I_{\text{supply\_MS}}$  are per port.

The current consumption numbers for  $I_{\text{supply\_DSP}}$  is per active lane on the line side.

**Table 338: Base Current Consumption (Per Chip)**

Symbol	Parameter	Pins	Condition	Min	Typ	Max	Units
$I_{\text{AVDD15\_Base}}$	1.5V analog supply	AVDD15_M AVDD15_N	All ports powered down		80	90	mA
$I_{\text{AVDD11\_Base}}$	1.1V analog supply	AVDD11_N	All ports powered down		20	140	mA
$I_{\text{AVDD10\_Base}}$	1.0V analog supply	AVDD10_M	All ports powered down		110	230	mA
$I_{\text{DVDD\_Base}}$	1.0V digital supply	DVDD	All ports powered down		640	3380	mA

**Table 339: AVDD15 Current Consumption by Mode (Per Port)**

Symbol	Parameter	Pins	Condition (host, line)	Min	Typ	Max	Units
I <sub>AVDD15_PCS</sub>	1.5V analog supply	AVDD15_M AVDD15_N	1000BASE-X, 1000BASE-X		340	390	mA

			10GBASE-R, 10GBASE-R		30	40	mA
			XAU1, 10GBASE-R		80	80	mA
			RXAU1, 10GBASE-R		40	40	mA
			Dual 1000BASE-X, 1000BASE-X		30	30	mA
			Dual 10GBASE-R, 10GBASE-R		80	80	mA
			Dual RXAU1, 10GBASE-R		80	80	mA

**Table 342: DVDD Current Consumption by Mode (Per Port)**

Symbol	Parameter	Pins	Condition (host, line)	Min	Typ	Max	Units
I <sub>DVDD_PCS</sub>	1.0V digital supply	DVDD	1000BASE-X, 1000BASE-X		40	50	mA
			10GBASE-R, 10GBASE-R		470	640	mA
			XAU1, 10GBASE-R		520	620	mA
			RXAU1, 10GBASE-R		500	570	mA
			Dual 1000BASE-X, 1000BASE-X		70	80	mA
			Dual 10GBASE-R, 10GBASE-R		520	800	mA
			Dual RXAU1, 10GBASE-R		590	900	mA

## 7.5 Digital I/O Electrical Specifications

### 7.5.1 DC Operating Conditions

**Table 343: DC Operating Conditions**

All digital I/O are on one of four supply rails – VDDOT, VDDOS, VDDOL, and VDDOM. Each supply rail can be independently programmed to operate at 1.2V, 1.5V, 1.8V, 2.5V, and 3.3V. See section [Section 3.13.4, DVDD](#), on page 82 for more details.  
(Over full range of values listed in the Recommended Operating Conditions unless otherwise specified)

Symbol	Parameter	Pins	Condition	Min	Typ	Max	Units
VIH	Input high voltage	All digital inputs	VDDO = 3.3V	2.0		VDDO + 0.6V	V
			VDDO = 2.5V	1.75		VDDO + 0.6V	V
			VDDO = 1.8V	1.26		VDDO + 0.6V	V
			VDDO = 1.5V	1.05		VDDO + 0.6V	V
			VDDO = 1.2V	0.84		VDDO + 0.6V	V
VIL	Input low voltage	All digital inputs	VDDO = 3.3V	-0.3		0.8	V
			VDDO = 2.5V	-0.3		0.75	V
			VDDO = 1.8V	-0.3		0.54	V
			VDDO = 1.5V	-0.3		0.45	V
			VDDO = 1.2V	-0.3		0.36	V
VOH	High level output voltage	All digital outputs	IOH = -4 mA	VDDO - 0.4V			V
VOL	Low level output voltage	All digital outputs	IOL = 4 mA			0.4	V
I <sub>ILK</sub>	Input leakage current	With internal pull-up resistor				10 -50	uA
		All others without resistor				10	uA
CIN	Input capacitance	All pins				5	pF

## 7.5.2 Reset Timing

**Table 344: Reset Timing**

(Over full range of values listed in the Recommended Operating Conditions unless otherwise specified)

Symbol	Parameter	Min	Typ	Max	Units
$T_{PU\_RESET}$	Valid power to RESET de-assertion	10			ms
$T_{SU\_CLK\_IN}$	Number of valid CLKP/CLKN cycles prior to RESET de-assertion	50			clks
$T_{RESET}$	Minimum reset pulse width during normal operation	10			ms

**Figure 31: Reset Timing**

### 7.5.3 MDC/MDIO Management Interface Timing

**Table 345: MDC/MDIO Management Interface Timing**

(Over full range of values listed in the Recommended Operating Conditions unless otherwise specified)

Symbol	Parameter	Condition	Min	Typ	Max	Units
$T_{DLY\_MDIO}$	MDC to MDIO (Output) Delay Time	25 pf load on MDIO	3.5ns + half cycle		19	ns
$T_{SU\_MDIO}$	MDIO (Input) to MDC Setup Time		6.5			ns
$T_{HD\_MDIO}$	MDIO (Input) to MDC Hold Time		0.5			ns
$T_{P\_MDC}$	MDC Period	Subject to $T_{READ\_DLY}$	25 <sup>1</sup>			ns
$T_{H\_MDC}$	MDC High		12			ns
$T_{L\_MDC}$	MDC Low		12			ns
$T_{READ\_DLY}$	Two MDC Period during Read Turnaround. For details, see <a href="#">Section 3.5.2, High-Speed MDC/MDIO Management Interface Protocol, on page 48.</a>		80			ns

1.  $T_{P\_MDC}$  is minimum of 25 ns for 40 MHz MDC clock support with stretched TA, but 40 ns (25 MHz) with standard TA as per IEEE specification. MDC of 40 MHz is supported only with VDDO supply of 1.8V and above. For lower VDDO, MDC frequency of up to 25 MHz is supported.

**Figure 32: MDC/MDIO Management Interface**

### 7.5.4 JTAG Timing

**Table 346: JTAG Timing**

(Over full range of values listed in the Recommended Operating Conditions unless otherwise specified)

Symbol	Parameter	Min	Typ	Max	Units
$T_{P\_TCK}$	TCK Period	60			ns
$T_{H\_TCK}$	TCK High	12			ns
$T_{L\_TCK}$	TCK Low	12			ns
$T_{SU\_TDI}$	TDI, TMS to TCK Setup Time	10			ns
$T_{HD\_TDI}$	TDI, TMS to TCK Hold Time	10			ns
$T_{DLY\_TDO}$	TCK to TDO Delay	0		15	ns

**Figure 33: JTAG Timing**

## 7.5.5 Two-wire Serial Interface (Master) Timing

**Table 347: Two-wire Serial Interface (Master) Timing**

(Over full range of values listed in the Recommended Operating Conditions unless otherwise specified)

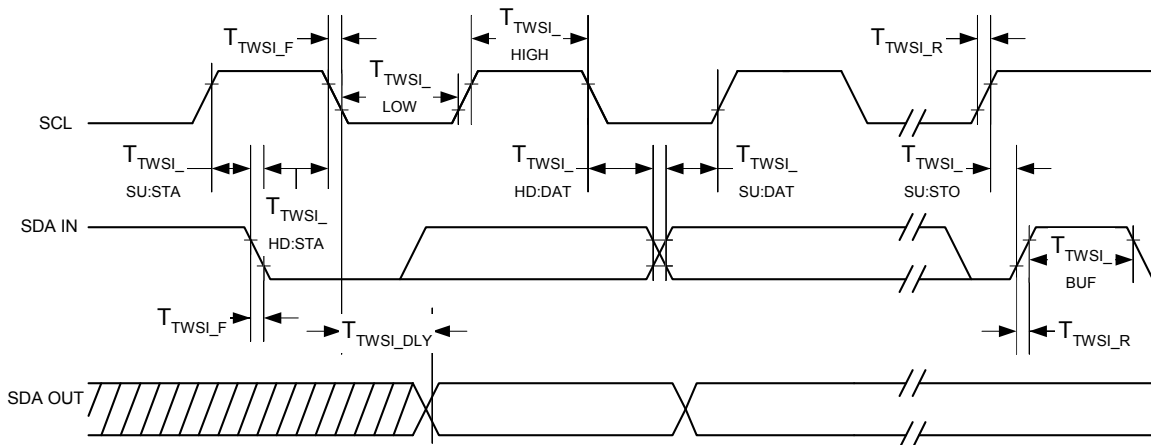

Symbol	Parameter	Condition	Min	Typ	Max	Units
$F_{TWSI\_SCL}$	SSCL Clock Frequency	100 kHz	100		400	kHz
$T_{TWSI\_NS}$	Noise Suppression Time at SSDA Inputs	100 kHz			80	ns
$T_{TWSI\_R}$	SSCL/SSDA Rise time	100 kHz			1000	ns
$T_{TWSI\_F}$	SSCL/SSDA Fall Time	100 kHz			300	ns
$T_{TWSI\_HIGH}$	Clock High Period	100 kHz	4000			ns
$T_{TWSI\_LOW}$	Clock Low Period	100 kHz	4700			ns
$T_{TWSI\_SU:STA}$	Start Condition Setup Time (for a Repeated Start Condition)	100 kHz	4700			ns
$T_{TWSI\_HD:STA}$	Start Condition Hold Time	100 kHz	4000			ns
$T_{TWSI\_SU:STO}$	Stop Condition Setup Time	100 kHz	4000			ns
$T_{TWSI\_SU:DAT}$	Data in Setup Time	100 kHz	250			ns
$T_{TWSI\_HD:DAT}$	Data in Hold Time	100 kHz	300			ns
$T_{TWSI\_BUF}$	Bus Free Time	100 kHz	4700			ns
$T_{TWSI\_DLY}$	SSCL Low to SSDA Data Out Valid	100 kHz	40		200	ns

**Note**

SSCL clock stretching is not supported

**Figure 34: TWSI Master Timing**

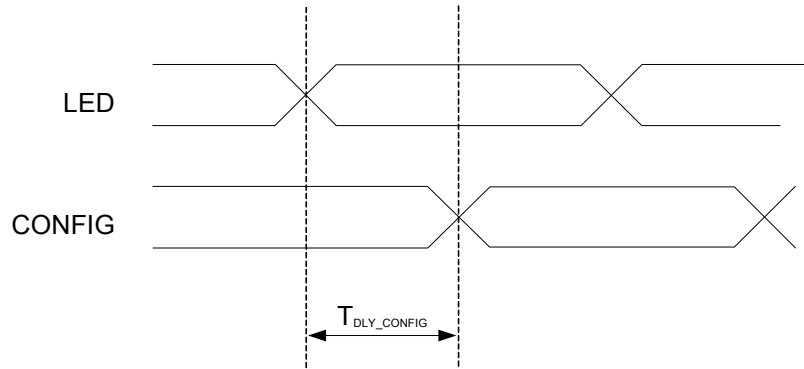

## 7.5.6 LED to CONFIG Timing

Table 348: LED to CONFIG Timing

Symbol	Parameter	Min	Typ	Max	Units
$T_{DLY\_CONFIG}$	LED to CONFIG Delay	0		25	ns

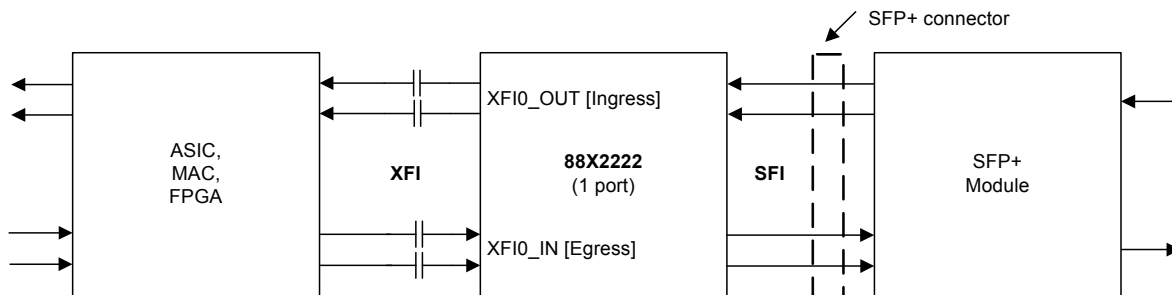

Figure 35: LED to CONFIG Timing

## 7.6 XFI

### 7.6.1 XFI Application Reference Model

Figure 36: XFI Application Reference Model

The high speed 10G serial electrical module interface includes XFIO\_OUTP/N and XFIO\_INP/N pins. All high speed SFI I/Os should be AC-coupled.

## 7.6.2 XFI Output (XFI[3:0]\_OUT) Specifications

The specifications shown in [Table 349](#) and [Table 350](#) are at 10.3125G at the output of the chip measured with a minimal loss channel terminated into  $2 \times 50\Omega$  through AC coupling.

**Table 349: XFI[3:0]\_OUT Electrical Specifications**

Symbol	Parameter	Condition	Min	Typ	Max	Units
$V_{diff}$	Differential Output Voltage		Note <sup>1</sup>		Note <sup>1</sup>	
$\Delta Z_M$	Termination Mismatch	See INF-8077i section 3.6			5	%
	Output AC Common Mode Voltage	See INF-8077i section 3.6			15	mV (RMS)
$t_{RH}, t_{FH}$	Output Rise and Fall times [20% to 80%]	Note <sup>2</sup>	24			ps
SDD22	Differential Output Reflection Coefficient	0.05 - 0.1 GHz	20			dB
		0.1 - 7.5 GHz	10			
SCC22	Common Mode Output Reflection Coefficient	0.1 - 15 GHz	6			dB

1. Differential output voltage shall meet the Y1 and Y2 eye mask values in [Table 350](#)

2. The eye mask limits the maximum output rise and fall times.

**Table 350: XFI[3:0]\_OUT Jitter Specifications**

Symbol	Parameter	Condition	Min	Typ	Max	Units	
DJ	Deterministic Jitter	See INF-8077i section 3.6			0.15	$UI_{pp}$	
TJ	Total Jitter				0.30	$UI_{pp}$	
X1	Eye Mask	See INF-8077i section 3.6			0.15	UI	
X2					0.40	UI	
Y1			180			mV	
Y2						385	mV

**Figure 37: XFI[3:0]\_OUT Differential Output Compliance Mask**

### 7.6.3 XFI[3:0]\_OUT 1 GbE Specifications

All voltage and jitter specifications at 1.25G are identical to the specifications at 10.3125G. Jitter and mask parameters scale with data rate (same UI values).

### 7.6.4 XFI Receiver (XFI[3:0]\_IN) Input Specifications

The specifications shown in [Table 351](#) and [Table 352](#) are at 10.3125G at the input of the chip measured with a minimal loss channel from a test equipment of  $2 \times 50\Omega$  impedance through AC coupling.

**Note**

XFI receiver specifications are generally based on datacom applications for FC-PI-3, point D. Point D sinusoidal jitter tolerance specifications account for the peaking impairments of a CDR in an XFP module. However, the 88X2222 device's receiver is located at the same point in a system where FC-PI-3 defines a module to be, which is point B. Since there is no CDR in this path, the sinusoidal jitter tolerance requirements for point B are used.

**Table 351: XFI[3:0]\_IN Electrical Specifications**

Symbol	Parameter	Condition	Min	Typ	Max	Units
Input AC Common Mode Voltage Tolerance	See FC-PI-3 section D.5.2				15	mV <sub>rms</sub>
SDD11	Differential Input Reflection Coefficient	0.05 - 0.1 GHz	20			dB
		0.1 - 7.5 GHz	10			
SCC11		0.1 - 15 GHz	6			dB
SCD11	Differential to Common Mode Conversion	0.1 - 15 GHz	12			dB

**Table 352: XFI[3:0]\_IN Jitter and Mask Specifications**

Symbol	Parameter	Condition	Min	Typ	Max	Units
TJ	Total Jitter	See INF-8077i section 3.6.			0.65	UI
	Total non-EQJ Jitter				0.45	UI
SJ	Sinusoidal Jitter Tolerance				See <sup>1</sup>	
X1	Eye Mask				0.325	
Y1	Eye Mask		55			
Y2	Eye Mask				525	

1. Sinusoidal jitter tolerance for datacom is given in [Figure 39 on page 240](#).

Figure 38: XFI[3:0]\_OUT Differential Channel Input Compliance Mask

Figure 39: XFI[3:0]\_IN Sinusoidal Jitter Tolerance Template at 10.3125G

### 7.6.5 XFI[3:0]\_IN 1GE Specifications

All voltage and jitter specifications at 1.25G are identical to the specifications at 10.3125G, except that the maximum input voltage swing that can be tolerated is 850 mV pk-pk. Jitter parameters scale with data rate (same UI values). Sinusoidal jitter tolerance frequencies scale with data rate.

## 7.7 SFI

### 7.7.1 SFI Specification Reference Model

Figure 40: SFI Specification Reference Model

The high-speed 10G serial electrical module interface includes SFI0\_OUTP/N and SFI0\_INP/N pins. All high speed SFI I/Os should be AC-coupled.

The SFI adheres to the electrical specifications for both limiting and linear interfaces defined in the SFF-8431 Specifications for Enhanced Small Form Factor Pluggable Module “SFP+”. For definitions for test points C”, B, and C, see SFF-8431.

### 7.7.2 SFI[3:0]\_OUT

The full set of 10G parameters and test conditions for output specifications at Test Point B are described in SFF8431 section 3.5.1 and section E.2 for a host channel which applies to the recommendations in Annex A of SFF-8431.

Table 353: SFI[3:0]\_OUT Output Electrical Specifications at B

Symbol	Parameter	Condition	Min	Typ	Max	Units
$S_{EOVR}$	Single Ended Output Voltage Range		-0.3		4.0	V
$\Delta Z_M$	Termination Mismatch	See SFF-8431 section D.16, Figure 55			5	%
	Output AC Common Mode Voltage	See SFF-8431, D.15			15	mV <sub>(RMS)</sub>
SDD22	Differential Output S-parameter	0.01 - 2 GHz			-12	dB
		2 - 11.1 GHz			See <sup>1</sup>	
SCC22	Common Mode Output S-parameter	0.01 - 2.5 GHz			See <sup>2</sup>	dB
		2.5 - 11.1 GHz			-3	

1. Reflection coefficient given by equation  $SDD22(dB) < -6.68 + 12.1 \times \log_{10}(f/5.5)$ , with f in GHz.

2. Reflection coefficient given by equation  $SCC22(dB) < -7 + 1.6 \times f$ , with f in GHz.

Table 354: SFI[3:0]\_OUT Output Jitter and Eye Mask Specifications at B

Symbol	Parameter	Condition	Min	Typ	Max	Units
$T_r, T_f$	Crosstalk Source Rise/Fall Time (20% - 80%)	See <sup>1</sup> SFF-8431, D.6		34		ps
	Crosstalk Source Amplitude (p-p differential)	See <sup>1</sup> SFF-8431, D.7		1000		mV
$T_r, T_f$	Signal Rise/Fall time (20% - 80%)	See SFF-8431, D.6	34			ps
TJ	Total Jitter	See SFF-8431, D.5			0.28	UI <sub>pp</sub>
DDJ	Data Dependent Jitter	See SFF-8431, D.3			0.1	UI <sub>pp</sub>
DDPWS	Data Dependent Pulse Width Shrinkage				0.055	UI <sub>pp</sub>
UJ	Uncorrelated Jitter	See SFF-8431, D.4			0.023	UI <sub>rms</sub>
$Q_{sq}$	Transmitter $Q_{sq}$	See SFF-8431, D8	50			
Eye Mask	X1	Mask hit ratio of $5 \times 10^{-5}$ see SFF-8431, D.2, <a href="#">Figure 41</a>			0.12	UI
	X2				0.33	UI
	Y1		95	mV		
	Y2		350	mV		
VMA	Voltage Modulation Amplitude	See SFF-8431, D.7	300			mV <sub>pp</sub>
TWDPc	Output TWDP	See <sup>2, 3</sup>			10.7	dBe

1. Measured at C" with Host Compliance Board and Module Compliance Board pair, see SFF-8431 [Figure 41](#).
2. Electrical output measured with LRM 14 taps FFE and 5 taps DFE Equalizer with PRBS9 for copper direct attached stressor, see SFF-8431 Appendix G.
3. The stressor for TWDPc is given in SFF-8431 Table 34 and is included in the code in SFF-8431 Appendix G.

Figure 41: SFI[3:0]\_OUT Output Mask for 10.3125 Gbps Operation

### 7.7.3 SFI[3:0]\_OUT 1GE Specifications

Specifications for 1.25 Gbps are per SFP-8431 section F.2 for the B point and assume the same channel recommendation as in SFF-8431 Annex A. 1G jitter specs at B are per IEEE 802.3 clause 38.5, TP1.

**Table 355: SFI[3:0]\_OUT Requirements to Support 1.25 Gbps Mode**

Symbol	Parameter	Condition	Min	Typ	Max	Units
$V_{out}$	SFI Output VMA Differential		500			mV
DJ	Deterministic Jitter	Assumes the channel recommendations in SFF-8431 Annex A.			0.1	UI
TJ	Total Jitter				0.24	UI
Eye Mask	Y1	See SFF-8431, D.2 and <a href="#">Figure 42</a>	150			mV
	Y2		500			mV

**Figure 42: SFI[3:0]\_OUT Output Mask for 1.25 Gbps Operation**

## 7.7.4 SFI[3:0]\_IN

The full set of 10G parameters and test conditions for Test Point C are described SFF-8431 sections 3.5.2 and E.3 with channels per the SFP channel specs SFF-8431 section A. This includes both linear and limiting.

**Table 356: SFI[3:0]\_IN Input Electrical Specifications at C**

Symbol	Parameter	Condition	Min	Typ	Max	Units
	Single Ended Input Voltage	Referenced to $V_{eeR}$	-0.3		4.0	V
	Input AC Common Mode Voltage Tolerance	See <sup>1</sup> and SFF-8431 D.15	7.5			mV <sub>rms</sub>
	Damage Threshold (p-p differential)	See <sup>1</sup>	2000			mV
SDD11	Differential Input S-parameter	0.01 to 2 GHz			-12	dB
		2 to 11.1 GHz			See <sup>2</sup>	
SCD11	Reflected Differential to Common Mode Conversion	0.1 to 11.1 GHz			-10	dB

1. Measured at C" with the Module Compliance Board.

2. Reflection Coefficient given by equation  $SDD11(dB) < -6.68 + 12.1 \times \log_{10}(f/5.5)$ , with f in GHz.

**Table 357: SFI[3:0]\_IN Supporting Limiting Module Input Compliance Test Signal Calibrated at C"**

Symbol	Parameter	Condition	Min	Target	Max	Units
$T_r, T_f$	Crosstalk Source Rise/Fall time (20%-80%)	SFF-8431, D.6		34		ps
	Crosstalk Source Amplitude (p-p differential)	See <sup>1</sup>		700		mV
	AC Common Mode Voltage	See <sup>2</sup> and SFF-8431, D.15			7.5	mV <sub>rms</sub>
J2	99% Jitter	See <sup>3</sup> and SFF-8431, D.5, D.11		0.42		UI <sub>pp</sub>
TJ	Total Jitter	BER $1 \times 10^{-12}$ , See SFF-8431 D.5, D11		0.70		UI <sub>pp</sub>
DDPWS	Pulse Width Shrinkage Jitter	See <sup>4</sup> and SFF-8431, D.3		0.3		UI <sub>pp</sub>
X1	Eye Mask	Mask hit ratio of $1 \times 10^{-12}$ , see SFF-8431 D.2, D11 and <a href="#">Figure 43</a>		0.35		UI
Y1	Eye Mask Amplitude Sensitivity <sup>5, 8</sup>			150		mV
Y2	Eye Mask Amplitude Overload <sup>6, 7, 8</sup>			425		mV

1. Measured at B" with host Compliance Board and Module Compliance Board pair, see SFF-8431 Figure 16.

2. The tester is not expected to generate this common mode voltage however its output must not exceed this value.

3. Includes sinusoidal jitter, per SFF-8431 figure 21, when measured with the reference PLL specified by the relevant IEEE standard.

4. In practice the test implementer may trade DDPWS with other pulse width shrinkage from the sinusoidal interferer.

5. Eye mask amplitude sensitivity tests the host receiver with the minimum eye opening expected at the input within the constraint set by Y2.

6. Eye mask amplitude overload test the host receiver tolerance to the largest peak signal levels expected at the input within the constraint set by Y1.

7. It is not expected that module Rx output will exhibit both maximum peak level and minimum eye opening.

8. Sensitivity and overload are tested separately, see SFF-8431 D.11.

Figure 43: SFI[3:0]\_IN Input Compliance Mask at C” Supporting Limiting Module

Table 358: SFI[3:0]\_IN Linear Passive Copper Module Compliance Test Signal Calibrated at C”

Symbol	Parameter	Condition	Min	Typ	Max	Units
$T_r, T_f$	Crosstalk Source Rise/Fall time (20%-80%)	See <sup>1</sup> , SFF-8431, D.6		34		ps
	Crosstalk Source Amplitude (p-p differential)	See <sup>1</sup>		700		mV
	AC Common Mode Voltage	See <sup>2</sup> and SFF-8431, D.15			7.5	mV <sub>rms</sub>
VMA	Differential Voltage Modulation Amplitude	For LRM see <sup>3</sup>	180		600	mV
	Differential Voltage Modulation Amplitude	For SR and LR see <sup>3</sup>	150		600	mV

1. Measured at B” with host Compliance Board and Module Compliance Board pair, see SFF-8431 Figure 16.
2. The tester is not expected to generate this common mode voltage however its output must not exceed this value.
3. Peak levels of received signals in service may exceed their VMA due to overshoot of the far end transmitter and/or the module receiver.

**Table 359: SFI[3:0]\_IN Linear Optical Module Compliance Test Signal Calibrated at C”**

Symbol	Applications	Compliance Stress Test Conditions, see <sup>1</sup> and <sup>2</sup> SFF-8431 D.13	Target WDP (dBo)	Target RN, (rms)		WDPI (dBo)
				m	b	
WDP	LRM	High WDP & precursor stressor	Approx. 5.1, see <sup>3</sup>	0.014	0.0477	4.1
		High WDP & split symmetric stressor	5.4	8		3.9
		High WDP & post cursor stressor	Approx. 5.2, see <sup>3</sup>			4.2
		Low WDP & precursor stressor	Approx. 4.7, see <sup>4</sup>			4.1
		Low WDP & split symmetric stressor	Approx 4.7, see <sup>4</sup>			3.9
		Low WDP & post cursor stressor	Approx. 4.8, see <sup>3</sup>			4.2
LR	Low WDP	Approx. 2.6, see <sup>4</sup>	-0.02			0.096

1. Target WDP is calibrated with a reference receiver with 14 T/2 spaced FFE taps and 5 T spaced DFE taps.
2. Target RN rms values are given by the following equation:  $RN=m \times (WDP-WDPI)+b$ , where WDP is the actual value of the tester, and WDPI values are based on wave shapes expected at TP3.
3. The filter bandwidth in the TP3 to electrical adaptor in SFF-8431 figure 52 is set to produce 5.4 dBo for WDP for the split-symmetrical TP3 stressor. The same filter is to be used for high WDP pre-cursor LRM stressors – their approximate target WDP values are given only for guidance. WDP is to be measured for each stressor, and target RN is determined by the relevant equation in note 2.
4. The filter bandwidth in TP3 to electrical adaptor in SFF-8431 Figure 52 is set to 7.5 GHz for all three LRM low WDP conditions and for LR condition. The approximate target WDP values are given for guidance. WDP is to be measured for each stressor, and target RN is determined by relevant equation in note 2.

For LR, the SFP+ linear host shall operate with sinusoidal jitter given by Figure 12 in SFF-8431, while the stress conditions given in Table 359 are applied. For LRM, the host shall operate with sinusoidal jitter as defined in IEEE802.3 clause 68, with the other stressors and noises in SFF-8431, Figure 52 turned off, including those in the TP3 tester.

**Table 360: SFI[3:0]\_IN Linear Passive Copper Compliance Test Signal Calibrated at C”**

Symbol	Parameter	Condition	Min	Typ Target	Max	Units
WDPc	Waveform Distortion Penalty of the ISI Generator	See <sup>1, 2</sup>		9.3		dBe
Q <sub>sq</sub>	Transmitter Q <sub>sq</sub>	See <sup>3, 4</sup>		63.1		
N <sub>o</sub>	Post channel fixed noise source	See <sup>5</sup>		2.14		mV <sub>rms</sub>
VMA	Differential Voltage Modulation Amplitude	See <sup>3</sup>		180		mV
	Differential Peak-Peak Voltage Overload			700		mV
	Input AC Common Mode Voltage	See <sup>6</sup> and SFF-8431 D.15.2			13.5	mV <sub>rms</sub>

1. Copper stressor as defined in SFF-8431 table 36. WDPc is measured with reference receiver with 14 FFE tabs and with 5 DFE taps, see SFF-8431 Appendix G.
2. WDPc for the stress is smaller than the transmitter TWDPc due the VMA loss in the host stressor.
3. Square patterns with eight ONEs and eight ZEROS.
4.  $Q_{sq}=1/RN$  if the one level and zero level noises are identical and see SFF-8431 D.8. Q<sub>sq</sub> is calibrated at the output of the MCB in a 12 GHz bandwidth with the ISI of the channel model in SFF-8431 figure 61 disabled. The source for N<sub>o</sub> should be disabled during this calibration.
5. N<sub>o</sub> is the rms voltage measured over one symbol period at the output of the MCB in a 12 GHz bandwidth. The source for Q<sub>sq</sub> should be disabled during this calibration.
6. AC common mode target value is achieved by adjusting relative delay of the P and N signals.

### 7.7.5 SFI[3:0]\_IN 1GE Specifications

1G voltage and jitter specifications are given in [Table 361](#) and [Figure 44](#). 1G jitter specs at C are per IEEE 802.3 clause 38.5, TP4.

**Table 361: SFI[3:0]\_IN Input Specifications at 1.25 Gbps at Point C**

Symbol	Parameter	Condition	Min	Typ	Max	Units
$V_{IN}$	SFI Input VMA Differential		370			mV
DJ	DJ Jitter	Assumes channel recommendations in SFF-8431 Annex A.			0.46	UI
TJ	Total Jitter				0.75	UI
Eye Mask	Y1	See SFF-8431 D.2 and <a href="#">Figure 44</a>	125			mV
	Y2		600			mV

**Figure 44: SFI0\_IN Input Mask for 1.25 Gbps Operation**

## 7.8 Reference Clock

Table 362: Reference Clock

Symbol	Parameter	Condition	Min	Typ	Max	Units
Fclk	Frequency	REF_CLK is 156.25 MHz.	-100 ppm	156.25	+100 ppm	MHz
		WAN_CLK is 155.25 if present	-100 ppm	155.25	+100 ppm	
tr, tf	Rise, fall time	20%-80% of swing	0.3	0.5	0.8	ns
Vppd	Amplitude	Differential pk-pk	0.4	0.8	1.6	V
Vin	Input Voltage Limits	Single-ended	0.0		AVDD15	V
Tduty	Duty cycle		0.45	0.5	0.55	
Tj	Jitter	Integrated from 1-30 MHz			0.5	ps, rms
Zin	Input Impedance	Differential	90	100	110	Ω
Vicm	Input CM	CLK can be DC coupled	0.1	0.85	AVDD15 - 0.1	V
SDD11	Input Return Loss	Differential, 100Ω			-12	db

Figure 45: Reference Clock Input Waveform

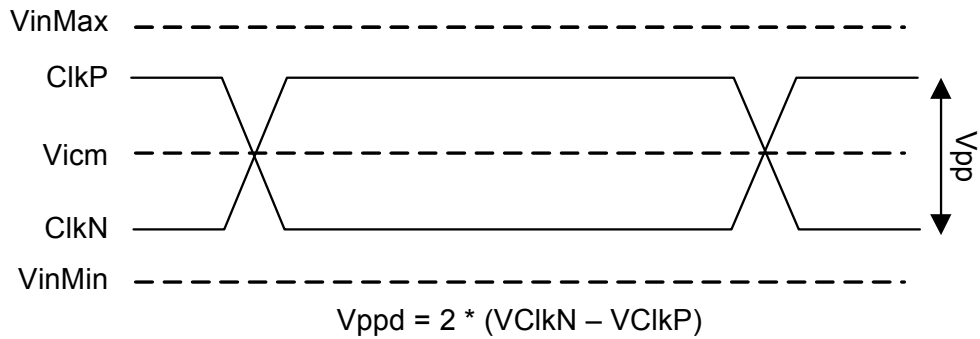

Figure 46: Simplified Reference Clock Input Schematics

## 7.9 Latency

The latency is calculated from the tables below by summing the various components.

$$\text{Total Egress Latency} = T_{\text{EGRESS}} + T_{\text{FEC\_TX}}$$

$$\text{Total Ingress Latency} = T_{\text{INGRESS}} + T_{\text{SFIDSP}} + T_{\text{FEC\_RX}}$$

$T_{\text{EGRESS}}$  and  $T_{\text{INGRESS}}$  are based on the data path selected.

**Table 363: Egress Latency**

Symbol	Parameter	Condition (host, line)	Min	Typ	Units
$T_{\text{EGRESS}}$	Egress Path Latency	1000BASE-X, 1000BASE-X	451		ns
		10GBASE-R, 10GBASE-R	160		ns
		XAUI, 10GBASE-R	243		ns
		RXAUI, 10GBASE-R	206		ns

**Table 364: Ingress Latency**

Symbol	Parameter	Condition (host, line)	Min	Typ	Max	Units
$T_{\text{INGRESS}}$	Ingress Path Latency	1000BASE-X, 1000BASE-X	451		473	ns
		10GBASE-R, 10GBASE-R	160		171	ns
		XAUI, 10GBASE-R	184		227	ns
		RXAUI, 10GBASE-R	161		169	ns

**Table 365: Electronic Dispersion Compensation DSP Latency**

Symbol	Parameter	Condition (host, line)	Min	Typ	Max	Units
$T_{\text{SFIDSP}}$	Incremental EDC Latency	10GBASE-R				ns

**Table 366: FEC Latency**

Symbol	Parameter	Condition (host, line)	Min	Typ	Max	Units
$T_{\text{FEC\_TX}}$	Transmit FEC Latency	10GBASE-R		13		ns
$R_{\text{FEC\_TX}}$	Receive FEC Latency	10GBASE-R		269		ns

# 8 Mechanical Drawings

# 9 Part Order Numbering/Package Marking

This section includes information on the following topics:

- [Section 9.1, Part Order Numbering](#)
- [Section 9.2, Package Marking](#)

## 9.1 Part Order Numbering

Figure 50 shows the part order numbering scheme for the 88X2222 device. Refer to Marvell Field Application Engineers (FAEs) or representatives for further information when ordering parts.

Figure 50: Sample Part Number

Table 367: 88X2222 Part Order Options

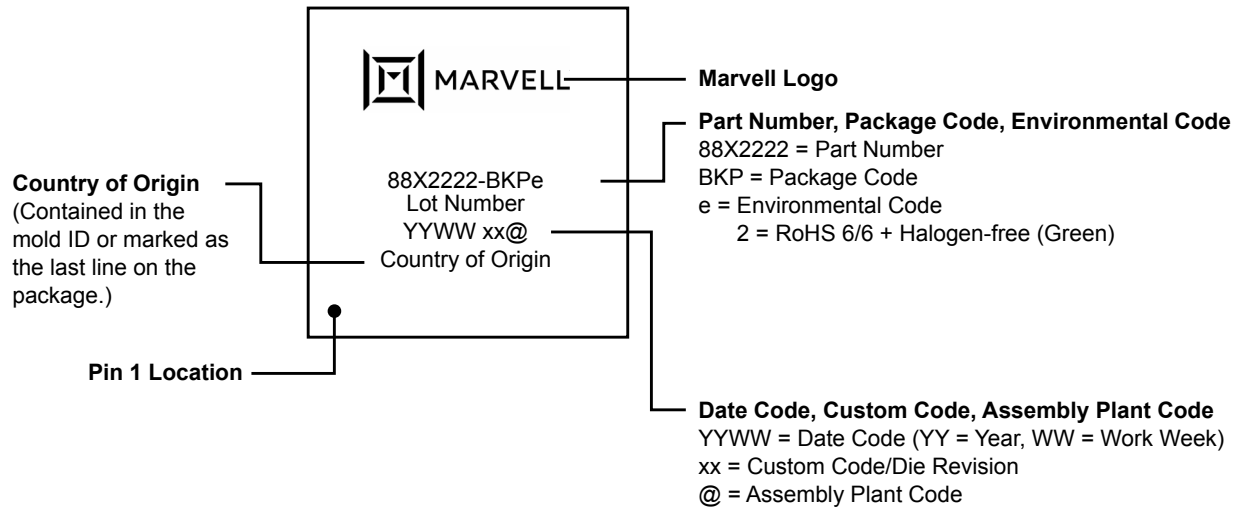

Package Type	Part Order Number
<b>Commercial</b>	
324-pin FCBGA	88X2222-XX-BKP2C000 (Commercial, Green, RoHS 6/6 + Halogen-free compliant package)

## 9.2 Package Marking

Figure 51 shows a sample Commercial package marking and pin 1 location for the 88X2222.

Figure 51: Commercial Package Marking and Pin 1 Location

Note: The above drawing is not drawn to scale. Location of markings is approximate.

---

# A Acronyms and Abbreviations

API	Application Programming Interface
ECC	Error Correction Circuit
EDC	Electronic Dispersion Compensation
FAE	Field Application Engineer
MDIO	Management Data Input/Output
PCS	
PLL	Phase Lock Loop
SFD	Start of Frame Delimiter
TAP	Test Access Port
TCK	Test Clock Input
TDI	Test Data Input
TDO	Test Data Output
TMS	Test Mode Select
TRSTn	Test Reset Input
TWSI	Two-Wire Serial Interface

# B Revision History

**Table 368: Revision History**

Revision	Date	Section	Detail
Rev. B	November 20, 2020	All applicable	<ul style="list-style-type: none"><li>• Disclaimer updated</li><li>• Corporate rebranding and template update</li><li>• New Marvell logos added to all figures with Marvell logo marking</li></ul>
Rev. A	September 24, 2018	All applicable	Cosmetic enhancements
		Host Side Description	Updated XAUI -Specific Generators and Checkers
		Electrical Specifications	Removed note and Table 339: Current Consumption for Digital I/Os from Section 7.4, Current Consumption
		Mechanical Drawings	Separated Figure 47: 324-Pin FCBGA Package Mechanical Drawings - Top View into Figure 47: 324-Pin FCBGA Package Mechanical Drawings - Top View and Figure 48: 324-Pin FCBGA Package Mechanical Drawings - Side View
		Acronyms and Abbreviations	New appendix added
Rev. --	June 28, 2018	All applicable	Initial release

Marvell first revolutionized the digital storage industry by moving information at speeds never thought possible. Today, that same breakthrough innovation remains at the heart of the company's storage, networking and connectivity solutions. With leading intellectual property and deep system-level knowledge, Marvell semiconductor solutions continue to transform the enterprise, cloud, automotive, industrial, and consumer markets. For more information, visit [www.marvell.com](http://www.marvell.com).
